A Science and Building Exhibition to be held at the Building Centre 158 New Bond Street London W., is being arranged by the Department of Scientific and Industrial Research It will be opened by Mr Percy Thomas P.R.I.B.A., on March 1 and will remain open until March 25 The object of the exhibition is to illustrate the work carried out by the various organizations controlled by the Department or associated with it of interest to the industry in the solution not only of general building problems but also of some of the more specialized problems which the industry is called upon to face The exhibition is very wide in its scope and among those participating are the Building Research Station the Fuel Research Station the National Physical Laboratory the Water Pollution Research Board, and the Department's chemical research laboratory

A medical tour organized by the Societe Medicale du Littoral Mediterraneen, will take place from March 21 to 28 All the resorts on the French Riviera from Hyeres to Mentone will be visited and receptions and scientific demonstrations will be held All medical men and their families are invited to join at the inclusive charge of 1 000 francs plus a booking fee of 50 francs per family A reduction of 40 per cent will be granted by the French railway companies A children's welfare congress concerning climatic conditions will also be held during the period under the presidency of Professor Nobecourt of the Paris Faculty of Medicine Particulars can be had from the Societe Medicale 24 Rue Verdi Nice (A.M.) and the Federation of the Health Resorts of France Tavistock House (North) Tavistock Square London W.C.

Some months ago the *Veterinary Journal* announced a proposal to present Sir Frederick Hobday the principal and dean of the Royal Veterinary College with his portrait in oils—the artist being Mr John Hassall The portrait was presented to Sir Frederick by the Duke and Duchess of Portland on behalf of the subscribers at the Connaught Rooms on February 18

A committee has been appointed with Professor Sergent as chairman to collect funds for and deal with the erection of a monument to Laennec in Paris Contributions may be sent to the treasurer of this committee Monsieur Doury 4 Rue de la Meutte Paris XVI

In regard to blood dissemination I have never denied that it occurs As a very rare event it may take place early Usually it is late, and in a majority of cases there is no evidence that it occurs at all

I was interested but puzzled by Mr Fitzwilliams's new "axiom" that "radium is practically useless in inaccessible cancer glands that can neither be seen nor felt are certainly inaccessible, we cannot even be sure of their existence in all cases" It is not the first time his statements have surprised me It was he who made the discovery that the average life of a truth is twenty years He is naturally perturbed that my views on breast cancer and its treatment have not been replaced by his own within that period

I am indebted to my friend Mr Geoffrey Keynes for correcting in his letter in the *Journal* of February 13 (p 358) my not unnatural misinterpretation of an ambiguity in his letter of January 30 (p 242)—I am, etc,

London, W 1, Feb 22 W SAMPSON HANDLEY

SIR—I was very glad to see Dr J H D Webster's letter in the *Journal* of February 13 (p 358) While I am only a general practitioner, it seems obvious to me that in order to achieve a higher survival rate in breast cancer some method must be employed of attacking the intrathoracic extensions of the growth which are beyond the range of the scalpel I have had the opportunity in the past of examining breasts and axillary glands from cases in which the primary growth alone had been treated by radium Extensive necrosis had occurred in the growth itself, but cell division, as evidenced by the great number of mitotic figures present, was proceeding in the glandular extensions at a much greater rate than that observed in cases treated by radical operation alone I think that by now this stimulating action of radium is well recognized Since intrathoracic extension occurs as soon as, or perhaps earlier than, the invasion of the axillary glands, is it not possible that the application of radium is as rational as the use of manure as a weed killer?

I have not yet had the opportunity of looking into Dr Webster's results, but from the tone of his letter I judge that they are encouraging If for no other reason than that his technique is based on sound theoretical principles they deserve to be—I am, etc,

Lisburn, Feb 16 W A PAGE, M D

Ludwig's Angina Treated with Prontosil

SIR,—The death rate from acute Ludwig's angina is so great and the methods one can use to prevent a fatal termination seem often so feeble that I feel no apology is needed to report the case given below I fully realize that little can be proved by one case (fortunately in our area we rarely see one, and so cannot collect a series), but the results here were so rapid and dramatic that perhaps others would like to try the same remedy

The man aged 28 who had put up with the pain for a week, was seen with an acute and very offensive alveolar abscess of the right lower jaw Trismus was very marked, and so was oedema of the parotid area An x-ray showed a buried wisdom tooth and on admission to our local hospital his condition was rapidly getting worse Under gas and ether, with great difficulty, the tooth was extracted Rigors followed his temperature rose to 103°, and he became delirious and mentally confused The oedema went up to his right eye and down to the level of the thyroid cartilage with marked inflammatory signs as well On the suggestion of the R M O prontosil was tried in addition to short wave treatment for ten minutes at a time After three doses his condition was greatly improved, temperature came down, and rigors stopped A slight rise in temperature was immediately controlled by two more injections of prontosil The local inflammation, which had suggested the necessity of external incisions, rapidly subsided The improvement continued, and within three or four days trismus had disappeared sufficiently for him to eat some solid food, and his recovery has continued at a rapid pace The swab from the alveolus showed a culture of pure streptococcus, not, however, haemolyticus

The rapidity of the change from the acutely dangerous septicaemic condition to one which gave no anxiety has been the most remarkable feature of this case—I am, etc,

Hayle, Cornwall, Feb 19 W H PALMER, M B, B S

Prostatectomy by the Two-stage Method

SIR,—I have read with interest and some surprise Mr W K Irwin's paper (*Journal*, February 6, p 261) on prostatectomy by the two stage method I feel that as one who has made a special study of the various prostatic operations mentioned by Mr Irwin I cannot allow his paper to pass without comment

Six deaths in 158 patients (3 7 per cent) submitted to prostatectomy is an excellent record, but it is a record which should be equalled by any competent surgeon, no matter what method he uses, always provided that he operates on no patient whose renal function does not come up to standard and whose cardiovascular system is sufficiently resilient to stand the strain of the operation with its associated anaesthesia It is noted that in 89 per cent of Mr Irwin's cases on whom a two stage operation was performed the second stage followed the first stage within fourteen days It thus follows that in only 11 per cent of his cases might a two-stage operation have been said to be essential As I have stated above the method of prostatectomy described by Mr Irwin is no safer than any other method It is the choice of the suitable patient and the degree of care taken with the preliminary treatment which really determines the mortality rate I disagree with Mr Irwin as to the necessity for a two stage operation as I believe that a one stage operation is the operation of choice

The first stage (suprapubic cystostomy) should be replaced by continuous drainage by means of an indwelling urethral catheter Mr Irwin obviously dislikes this method of drainage and refers thus to the indwelling catheter To some patients [it] is an instrument of torture and to all a method of treatment conducive to sepsis' Such a statement might be believed by some of your readers lacking experience in the use of the indwelling catheter It is not my experience A soft rubber catheter, size 7 to 10, can be passed without difficulty and without pain in about 90 per cent of patients It is fixed to the skin of the penis by elastoplast adhesive, the parts previously having been shaved The catheter is then connected by tubing led under the thigh to a sterilized bottle at the bedside This bottle contains a measured quantity of antiseptic solution, in which the free end of the tube is immersed, thus providing a siphon drainage A small swab soaked in acriflavine is inserted under the adhesive around the catheter where it issues from the external urethral meatus This swab is changed daily Finally the penis and the proximal part of the catheter issuing from it are rolled in a sterile gauze swab The bladder is gently washed out through the catheter once each day with a weak solution of potassium permanganate followed by sterile water and then silver nitrate in 1 in 3,000 solution The patient hardly knows of the existence of the catheter He remains perfectly comfortable and any sepsis present in the bladder is rapidly eradicated Where gradual decompression of the distended bladder is necessary a Kidd's tube fixed to the end of the drainage tube is inserted into an empty sterile bottle fixed at the

QUERIES AND ANSWERS

Cure for Chilblains?

CAPTAIN CHARLES STARR writes The following case may be of interest A woman I had been treating for severe chilblains of the fingers for two months by the conventional methods with no improvement developed influenza, which was accompanied by a pyrexia of 103° F for forty eight hours On the third day of the illness all her chilblains had disappeared and have not returned during the last three weeks The question arises as to whether their disappearance was incidental to the pyrexia and due to the patient remaining in bed and in an even temperature, or whether due to her pyrexia causing improved circulation to the fingers I can find no mention of this phenomenon in the literature at my disposal

External Use of Iodine

"E P" writes As regards Dr Macaulay's contention (February 13 p 374) that iodine is of no use applied to cuts and abrasions, I think there is a good deal of truth in his argument I should like, however, to know what he proposes in place of it

Income Tax

New Practice—Replacement of Car

"W B" bought a car in July 1933, and commenced in practice in November 1933 and hitherto has been allowed three quarters of the expense of running the car he intends to claim seven eighths for 1936-7 He now proposes to buy a new car retaining the old one for family use What should he claim?

*** So long as the old car is available for professional use—for example in the case of a temporary breakdown of the new one— W B may find it impossible to claim a replacement allowance In all the circumstances we advise him to claim depreciation" for the past and present years, starting with the value of the car as at November 1933 and claiming four fifths to seven eighths of 22 per cent on the usual "written down basis

Allowance for Bad Debts

"J H" explains that the inspector of taxes was 'dissatisfied with the old method of valuing the book debts,' and in consequence a specific valuation' was made On that basis the former reserve was excessive by £300, and the inspector proposes to assess that amount for the back years

*** The income tax authorities are entitled to rectify any under assessments arising from excessive reserves so far as the current and six previous years of assessment are concerned, but no more If therefore, the excess arose on the accounts for 1929 or a later year—1929 is the year determining the liability for the financial year 1930 1—the over allowance can be dealt with by additional assessment It does not seem necessary that the inspector should be able to show in which year the under assessment arose, the general evidence being available the allocation of the £300 between the various years would be a matter of agreement after discussion or for settlement by the commissioners on appeal

LETTERS, NOTES, ETC.

Uraemia in Ophthalmology

DR HORATIO MATTHEWS (ophthalmic surgeon to the King Edward Memorial Hospital, Ealing) writes Among the points to be watched in the treatment of eye cases are the occasional idiosyncrasies to atropine and hyoscine Recent cases of death after cataract extraction in aged people in whom uraemia spoilt an otherwise perfect cure suggest that possibly there is more than meets the eye in certain of the troublesome post cataract extraction mania with which one is worried from time to time Is it possible that blood urea tests before the operation might reveal both the cause of the so called atropine mania' and of the cataract itself? In the uraemic cases referred to there was no previous sign of renal disorder beyond a slight amount of seemingly innocent albuminuria

Academic Costume

DR R R PRIOR writes from the Infants Hospital, Vincent Square S W I beg to point out that the answer to 'X Y Z's suggestion of last week is not correct The right to wear an academic hood is by no means reserved to those who hold university degrees Most of the theological colleges in this country grant hoods to their diplomates and so do some twenty other learned societies and institutions If music, art, and philosophy are rewarded in this way it seems hard that physicians surgeons and dental surgeons should have only an incomplete academic dress I agree with "X Y Z" that the great medical corporations should prescribe hoods for their members and licentiates and thereby add to the dignity not only of their diplomas but of those corporations themselves

Cancer Cells and Revolutionary Groups

MR GEORGE SACKS F R C S, writes from Capetown Mr W H Ogilvie combines the art of writing with the art of instruction so admirably that you could have made no better choice for the first article in the new *Journal* In it he says truly that the humanity of surgery has three aspects—science, art religion, we know, we feel we believe I suggest that we need not confine these aspects of our humanity to surgery alone The three are necessary to a sane and balanced whole, he says They are just as necessary to a sane and balanced whole in our evaluation of social and political structure When he compares the appearance of lawless cancer cells in the human body to the emergence of revolutionary groups in the body politic I makes a comparison which a sane and balanced judgement might hesitate to accept Cancer is always an evil thing in the human body, and it never in any circumstances improves the health of the organism it has invaded Revolution, on the other hand, may transform the health of the body politic Since I know how anxious Mr Ogilvie is to know as well as to feel and believe, I implore him to read *Armed Intervention in the U.S.S.R* The book a much neglected one is written by Mr and Mrs Cortes and is published by Gollancz In the light of knowledge he might care subsequently to revise his opinion as to the responsibility for "the slaughter in cold blood of some three million innocent people' My point is that if we are to introduce social judgements into records of surgical reflections we should be as careful to use the three aspects of our humanity in our sociology as in our surgery

Bismuth Therapy

We have received from Pharmaceutical Specialities (May and Baker) Ltd a copy of their latest publication *Bismuth Therapy* This little book outlines present day views on the subject, and marks the twenty first year of this firm as manufacturers of anti syphilitic preparations

7 *Direct comparison of the clinical attacks among the inoculated individuals and the control group (uninoculated) shows a significant advantage to the former in respect of initial manifestations severity of main features and complication and fatality rates*

Failing the obtaining of convalescent or adult serum in emergency there is always the possibility of using the blood of either parent The dose recommended is 30 c.cm. half being injected into each buttock Encouraging results have been reported in regard to the use of globulin prepared from human placentas which if substantiated should prove a useful source in the future

New Legislation

Some of the recent legislation regarding public health comes into operation as from January 1st 1937 this date applying to the Consolidating Housing Act 1936 though not to the Consolidating Public Health Act which does not take effect until October 1st By the Shops Act 1936 lending libraries are to be brought within the scope of the Shops Acts as the expression retail trade or business is now to include the 'business of lending books or periodicals when carried on for purposes of gain The main provisions of the Act which will affect a commercial lending library whether carried on as a separate business or in connexion with any other business are those relating to hours of closing to assistants half holidays to the regulation of hours of work of young persons and to the health and comfort of shop assistants The Shop (Sunday Trading Restriction) Act 1936 will not come into force until May 1st

By Section 3 of the Housing Act 1936 the occupier or the landlord of a dwelling house who after the appointed date causes or permits it to be overcrowded shall be guilty of an offence subject to certain safeguards provided in the Act relating to the opportunities of the occupier to obtain other accommodation In most districts throughout the country the appointed day has been fixed as January 1st

The main provisions of the Milk (Special Designations) Order 1936 which prescribed new designations for the grades of milk, came into force during the year The Order prescribed plate count bacteriological tests for raw Tuberculin tested and Accredited milks until December 31st, 1936, but after that date a methylene blue reduction test The principle of this test is that the rapidity with which a solution of methylene blue is decolorized when incubated with a certain volume of milk is a measure of the dirtiness of the milk Memo 139/Foods recently issued by the Ministry of Health contains full particulars of the technique for the carrying out of the test

By Section 1 (2) of the Midwives Act, 1936 which came into operation on July 31st 1936 every local authority is required to submit within a period of six months from the commencement of the Act its proposals for carrying out its duties under the Act These proposals except in regard to any district to which the Minister has agreed to a longer period must therefore be in by January 30th

Public Health Medical Service

The following changes have recently been made in the public health medical service staffs

Dr R A C Herron to be assistant medical officer for Armagh County Mental Hospital

Dr R Lynn to be district medical officer for Bath

The death is announced of Dr John Wilkinson who for thirty three years was medical officer of health for Droitwich rural district

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

Advertising and Canvassing

No medical practitioner should attempt in any way to advertise himself or to gain reputation except by the legitimate means of proficiency in his work and by skill and success in the practice of his profession In this connexion attention is drawn to paragraph 6 of the warning issued by the General Medical Council

> The practices by a registered medical practitioner
>
> (*a*) of advertising whether directly or indirectly for the purpose of obtaining patients or promoting his professional advantage or of authorising or sanctioning or acquiescing in the publication commending or directing attention to the practitioner's professional skill knowledge services or qualifications or depreciating those of others or of being associated with or employed by those who procure or sanction such advertising or publication and
>
> (*b*) of canvassing or employing any agent or canvasser for the purpose of obtaining patients or of sanctioning or of being associated with or employed by those who practise such employment
>
> are in the opinion of the Council contrary to the public interest and discreditable to the profession and any registered medical practitioner who so conducts or advertises his practice renders himself liable on proof of the fact to his name erased from the *Medical Register*

The word advertising in relation to the medical profession must be taken in its broadest sense It includes those methods by which a practitioner is made known to the public either by himself or by others without objection in a manner which can fairly be regarded as having for its purpose the obtaining of patients or the promotion in other ways of the practitioner's individual professional advantage Any medical practitioner who furnishes or inspires any notice report interview or article which refers to himself professionally and which is calculated in any way to attract patients to him renders himself liable to severe penalties by the General Medical Council Not only should a practitioner avoid advertising but he should take care that others do not advertise on his behalf The recognized channels for discussion between members of the medical profession for research results and for bringing to the notice of the profession books published and facilities for treatment offered are medical societies medical journals and periodicals and works primarily intended for the medical profession

The publication of books and the delivery of lectures on semi medical topics which are of general public interest and require medical knowledge for their proper presentation have been recognized as legitimate subject to the avoidance of methods which tend to the personal professional advantage of their authors There are certain things innocent in themselves which may by the manner and frequency of their doing gravely contravene the principle that medical practitioners should not advertise

The lay press should never be utilized to publish a change of address or to announce the practitioner's surgery or consulting hours There is no objection however to a notice regarding such matters being issued by circular letter to the patients of the practice Such circular should be issued in envelopes and be confined to those whose names are on the books of the practice and are not known

to have transferred themselves elsewhere The issue by a practitioner of a circular or letter containing information regarding special practice or treatment which he proposes to undertake must be confined to members of the medical profession, and no laudatory allusion to his work in this connexion or any claims of special success should appear

The exhibition of professional cards in public places such as hotels, club-houses, workshops, or the dressing-rooms of theatres, even though the practitioner concerned is the usual medical attendant employed, is to be strongly condemned All that is required is the posting of a notice to the effect that in cases of accident or illness the services of a doctor can be obtained upon application to the office or to some responsible person Medical practitioners should take care that sickness benefit societies, clubs, or kindred institutions with which they are in any way connected do not make use of their names without consent The circulation of professional cards to chemists is regarded as a form of advertising just as much as is a similar circulation to members of the lay public Canvassing for patients, either directly or indirectly in any shape or form, should be strictly avoided It is an offence of which the General Medical Council takes a most serious view

INSURANCE MEDICAL SERVICE WEEK BY WEEK

A DECISION WHICH DECIDES NOTHING

It may be presumed in the ordinary course when a decision is given on appeal that one of the parties is satisfied, but this is a presumption which is capable of rebuttal, as the legal advisers to the Ministry of Health would say Indeed the Ministry's advisers used this expression in a decision on appeal reported in this column on August 8th last The report of this case in these notes was prefaced by the following paragraph

> Two cases of an unusual character, each having considerable interest for insurance practitioners, are reported this week In the first case an insurance committee has been left in a state of bewilderment by a decision of the Minister on an appeal, and has in effect said so in the terms of the resolutions which have been passed In the second the practitioner has at his own request, attended before a medical service subcommittee to argue not that the medical service for which he had charged a fee was outside his insurance contract, but that it ought to be

By a curious chance the second case referred to in the paragraph above is now the subject of a decision on appeal which it may fairly be expected, will also leave the Insurance Committee in a state of bewilderment

A doctor was called out of his bed at midnight to visit a patient and arrest an excessive haemorrhage of the gums following the extraction of teeth He reflected that this was a dentist's job and that therefore he was entitled to charge a fee for his services In due course he mentioned to his Panel Committee that it was really time that this sort of service ought to be excluded from the insurance practitioner's contract The Panel Committee thought that there was some force in this contention, and passed on the idea to the Insurance Acts Committee The Insurance Acts Committee felt unable to endorse the view of the doctor that he ought to be relieved of responsibility for this type of service In the meantime the patient, who was an insured person asked for his money back and the doctor expressed the desire that this application should go for formal hearing to the Medical Service Subcommittee The Medical Service Subcommittee, recognizing that the practitioner's desire was to raise a test case rather than to evade his obligations, was confronted with a most unusual circumstance The practitioner did not contend that the service rendered by him to the insured person involved the application of skill and experience which general practitioners as a class do not possess, nor did he argue that the service was not a medical service His arguments in fact were not directed to the contention that the service was outside his obligations under the Terms of Service but that it ought to be The practitioner, having been furnished with a copy of a report of referees in precisely a similar set of circumstances, would indeed have found it difficult to argue that the service was outside the scope of his obligations in view of the following statements made in the course of the referees report

> "It will be seen that the question is not whether the service is one which could properly be undertaken by a general practitioner of ordinary professional competence and skill but whether it was treatment—that is, medical attendance and treatment'—within the meaning of the practitioner's agreement with the Insurance Committee We feel some difficulty even in formulating the view that the arrest of haemorrhage of the gums occurring seven hours after the extraction of teeth is not medical treatment If the case of an injury of this nature, admittedly within the competence of the practitioner, is not medical treatment we are at a loss what meaning to attach to the term The contention may however mean that it was the duty of the dentist to stop the bleeding—though no evidence is offered that the dentist was available for the purpose On this hypothesis again we fail to see the relevance of this contention The failure in duty on the part of one person is not an excuse for the failure of another to perform a contract with, and for the benefit of, persons in no way privy to the failure The bleeding at 11 30 in the night was a matter calling for the medical treatment which the practitioner was bound to give, and his obligations were in no way affected by the origin of the bleeding

The Insurance Committee, upon the consideration of the report of the Medical Service Subcommittee, decided that the practitioner should refund the fee of 10s which the insured person had paid, and the practitioner appealed The Minister has now decided that the case may be determined summarily It appears to him that the question whether the service rendered to the insured person in this case was within the scope of the practitioner's obligations under the Terms of Service was a matter to be dealt with in the first instance by the Local Medical Committee in accordance with the provisions of Article 43 of the Medical Benefit Consolidated Regulations, 1928 and that in the circumstances the findings and recommendation of the subcommittee and the decision of the Insurance Committee based on them were invalid The Minister has accordingly decided that the practitioner's appeal must be allowed The Minister, however, invites the practitioner's attention to the fact that allowance of the appeal does not imply any decision on the question whether the service rendered to the insured person in this case—namely, the treatment of haemorrhage following dental extraction—fell within the scope of the practitioner's obligations under the Terms of Service or not

We have said that the presumption that one of the parties to an appeal would usually be satisfied with the result is capable of rebuttal The present decision cannot satisfy the insured person, who has paid a fee for a service which the practitioner did not seriously argue was outside his existing obligations The practitioner must be dissatisfied because he has not been given the opportunity of expounding his arguments in person to an appeal tribunal and because the "decision" tells him that he must not run away with the idea that his arguments have any validity The Insurance Committee must be

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

151 Recurrent Ulcers of Mouth and Vulva

O Michaelis (*Brun med* January 3 1937 p 336) describes a case of recurrent aphthous ulcers of the mouth and vulva in a woman of 47 years She was suffering from extensive superficial ulceration of the mucosa of the mouth Her teeth had previously been removed on account of gingivitis and pyorrhoea but this had not improved the condition of her mouth Ulceration recurred, often before menstruation, and similar but less widespread ulceration was seen on the vulva. The patient had lost weight and was in poor condition, but responded well to treatment At the end of a week nearly all the buccal ulcers had gone and she was gaining rapidly in weight A month later an attack of congestion of the liver, accompanied by menstruation was followed by a slight return of ulceration in the left cheek Treatment was continued for a further one and a half months, and *eventually all signs of ulceration disappeared* and menstruation ceased Some months later this was resumed, but without any untoward symptoms No direct cause for this ulceration such as syphilis gonorrhoea or tuberculosis could be found and the question of microbic origin was ruled out It is suggested that an endocrine factor may influence the production of these aphthous ulcers of the mouth and vulva They have been seen in children during an epidemic of measles and may occur at any age. They may be associated with some endocrine change such as castration or the menopause.

152 Recurrent Infectious Parotitis

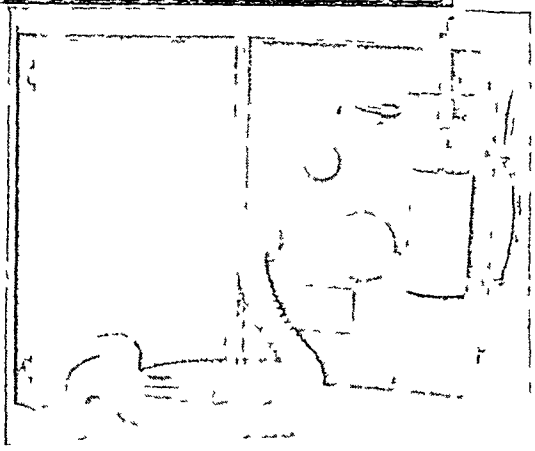
C R Brown and W B Nevius (*Amer J Dis Child* December, 1936, p 1424) who record an illustrative case class infections of the parotid glands into the following four groups (1) the epidemic form, (2) the post operative form, (3) the type associated with typhoid, scarlet fever, and septicaemia, and (4) a chronic recurrent form the aetiology of which is obscure Of eighteen cases of the last form collected in 1933 by Londe and Pelz, nine were in boys and nine in girls whose ages ranged from 1 month to 16 years The involvement was bilateral in only five cases and the duration of the disease ranged from one month to six and a half years The present case was that of a boy who, from the age of 3 months to that of 5 years had had about ten intermittent attacks of swelling of the parotid glands The attacks which were associated with repeated infections of the upper respiratory tract, ceased after tonsillectomy and adenoidectomy

153 Permanent Cardiac Damage Following Diphtheria

A Beer (*Jhrb Kinderheilk* December, 1936 p 152) states that clinical and pathological findings are far from settling the question as to whether the heart can be permanently damaged after an attack of diphtheria Since the introduction of electrocardiography a large number of writers have discussed the question but without an agreement having been reached Beer now records his observations on forty two cases of diphtheria which had shown signs of severe cardiac disturbance during an attack of diphtheria at the Wilhelmina Hospital Vienna during the period 1928–35 Only seven of these showed obvious clinical signs of cardiac disease although the electrocardiographic signs were only slight In three cases the attack of diphtheria had been one year and in one case three years previously The three other patients who had left hospital from two to four years previously showed only slight changes in the electrocardiogram Beer comes to the conclusion that the damage to the heart caused by diphtheria disappears to a large extent in the course of a few years.

154 Lung Involvement in Bone Tuberculosis

W Deutschmann (*Dtsch Tuberk bl*, November 1936 p 228) considers the teaching that pulmonary tuberculosis is a rare sequel to tuberculosis of the bones and joints and that an extrapulmonary focus of disease has a beneficial effect on an already existing pulmonary tuberculosis to be fallacious As this fallacy dies hard the author has undertaken a special study of the material in his hospital during the past few years in order to disprove it statistically He has grouped his cases of tuberculosis of the bones and joints in two categories, according as the disease was recent or chronic To the first category belonged those cases whose clinical history and radiological findings did not date further back than three years Of the total of seventy eight cases thirty six belonged to this category, while the remainder represented chronic forms of bone and joint tuberculosis In the first category signs of tuberculosis of the lungs were found in 84 per cent In about 28 per cent these signs were only radiological and were for the moment at any rate of no clinical importance In more than half of all the cases in the first category there were signs of active pulmonary disease, in most cases of symmetrical distribution While active pulmonary disease was the rule rather than the exception in the first category the cases in the second category were for the most part characterized by the latency and clinical insignificance of the pulmonary disease. Active pulmonary disease was however, demonstrable in about 31 per cent of the cases in the second category The lessons the author draws from these findings are that active pulmonary tuberculosis is very common associated with tuberculosis of the bones and joints particularly when it is of recent origin and that though the pulmonary disease in such cases nearly always belongs to Ranke's second stage and shows a marked tendency to spontaneous healing an extra pulmonary tuberculous focus does not have a favourable influence on the course of the disease in the lungs



155 X Rays in Hyperthyroidism

J H Harris and E Rose (*Amer J Roentgen* November, 1936 p 610) analyse the results of x ray treatment in 244 patients suffering from hyperthyroidism The method of treatment varied according to circumstances At first a routine treatment was given This consisted of irradiations at 135 kV (peak) 5 mA, 30 cm focus skin distance with filtration through 0·25 mm of copper plus 1 mm of aluminium 400 r units (in air) were given in one sitting through an anterior single port of entry Occasionally a similar dose was given through a posterior field one to seven days later The series was repeated two or three times at three-week intervals When the response to this treatment proved inadequate the technique was altered to 165 kV (constant potential) 15 mA 50 cm focus skin distance with filtration through 0·5 mm of copper plus 2 mm of aluminium Three doses of 600 r units each were given at forty eight hour intervals through a single anterior port of entry the larynx being shielded Similar series were repeated at intervals of four weeks up to a total of 6·400 r units The authors have arrived at the following conclusions In unselected cases of hyperthyroidism irradiation is probably inferior to expertly performed thyroidectomy Irradiation possesses the advantages of negligible mortality of absence of major complications of low cost of absence of physical and psychic shock, and of maintaining the earning capacity of

The "QUEEN CHARLOTTE'S" Portable GAS AND AIR MACHINE

The British Oxygen Company has produced a portable apparatus for gas and air administration, intended mainly for use by midwives its outstanding features are complete safety, low cost, portability compactness, simplicity

For midwives general practitioners or dentists Model B (illustrated) is most suitable In size and shape it is like an attache case, convenient for carrying or strapping to a bicycle carrier and its price without cylinder is £12 12 0 The working is simplicity itself and its general appearance inspires confidence in the user An intelligent patient can safely administer the gas to herself for the quantity of gas inhaled is 'self controlled by the patient's breathing Model A is lighter and smaller Model C is larger and has room for two cylinders Prices respectively, £11 11 0 and £13 2 6

Model B (as illustrated) without cylinder, **£12 12 0**

Spare parts and service from any B O C Branch Nitrous Oxide supplies delivered by motor in important towns

DESIGNED FOR SAFETY LOW COST

PORTABILITY · COMPACTNESS SIMPLICITY

IN USE AT QUEEN CHARLOTTES HOSPITAL

HEARING AID . . .

You Can Confidently Recommend this **2-Valve 'High Fidelity'**

AMPLIVOX

A pocket model Valve Amplifier with all its inherent advantages of long range high fidelity and convenient size is something new in the history of Hearing Aids But Amplivox have accomplished the seemingly impossible thanks to an ingenious lay out and the use of special midget valves With Amplivox hearing aids the deaf can hear at a distance and join in general conversation All models have a frequency range of 50 to 6 000 cycles per second which means that for all practical purposes they are absolutely distortionless In recommending Amplivox for all types of deafness you will be in the company of many eminent medical men Write to day for the Amplivox brochure No model costs more than 18 gns and your patients can have one on a week's trial in their own home

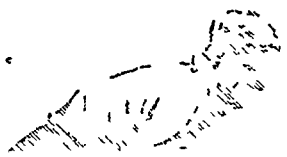
the patients during the treatment in the majority of cases Its use is indicated in the following selected types of hyperthyroidism in children and adolescents, except in those with nodular goitres and cardiac complications, in mild to moderately toxic adults without visceral complications or marked loss of weight and who have a diffuse soft or elastic goitre with symptoms of sympathetic nervous disturbances The treatment is further indicated where the surgical risks are great or where the patient refuses operation, or in patients with recurrent post-operative hyperthyroidism which cannot be controlled by iodization In the presence of a progressive increase in the severity of the disease irradiation should be abandoned and the patient prepared for thyroidectomy

Surgery

156 Prognosis of Gastric and Duodenal Perforation

E Schneider (*Dtsch med Wschr*, November 6, 1936, p 1825) finds that, as far as his own experience is concerned at the University Hospital in Freiburg-i-Br, the frequency of acute perforations of gastric and duodenal ulcers has diminished during the past three years In the course of the past six years he has had to deal with fifty five ulcer perforations, only five of which were in women This comparative liability of males to ulcer perforations seems to be ubiquitous Professor Schneider has classified his fifty-five cases in four groups, according to the length of the interval between perforation and operation There was only one death among the twenty-five patients operated on within six hours of perforation There were four deaths among the fourteen patients operated on between seven and twelve hours after perforation When this interval was between thirteen and twenty-four hours four of the twelve patients in this third group died All the four cases operated on more than twenty four hours after perforation ended fatally The patient's life would therefore seem to hinge on the early advent of a doctor and his prompt recognition of the needs of the case With the patient's fate determined by the earliness of a correct diagnosis the simple clinical examination is of far greater importance than any highly technical test which, if it implies delay, is rather a danger and a hindrance than the reverse With regard to the character of the operative treatment the author is in favour of appropriate treatment for the peritonitis and the closing of the ulcer with sutures This is undoubtedly the simplest, quickest, and most conservative procedure, and only when this suturing has been completed and stenosis of the pylorus is found to exist should a posterior retrocolic gastro enterostomy be performed

157 Angioma Racemosum Capitis



N v Hedry (*Zbl Chir*, January 2, 1937, p 22) describes the operative treatment of a case of angioma racemosum capitis which had been treated conservatively for over twenty years without result A female patient, aged 36, was said to have had the angioma since birth The tumour enlarged at puberty and during pregnancy She complained of continual headache, noises in the ear, and vertigo The angioma covered the entire scalp On palpation a "thrill" was felt, and the impression obtained 'as if worms were crawling between the fingers" Operation was carried out in three stages In the first operation the superficial temporal arteries were ligatured just in front of the ear Three months later both occipital arteries and their mastoid branches were ligatured Following *operation the "thrill" on palpation* disappeared At the third operation a month later the angioma was encircled by a continuous percutaneous suture through which a thin rubber tube was threaded By pulling on the suture the operation area became bloodless and the angioma was removed through a circular incision The rubber tube was removed in ten and the suture in twelve days The author insists that early operation is essential, for apart from cosmetic reasons there is ever-present danger from infection and haemorrhage

158 Local Infiltration of Post-traumatic Lesions

A Dumont (*Scalpel*, Liége, January 16, 1937, p 78) states that the method of treatment of post traumatic lesions by means of local anaesthesia has been tried for several years, but it is only recently that this treatment has been used extensively A series of fifty cases is reported of articular or periarticular injuries in which complete recovery of function took place after treatment by local infiltration In a typical case which is fully described a young man was suffering from a strain of the foot with localized oedema, ecchymosis, acute pain, and inability to walk The treatment of Leriche was carried out and consisted of the injection of 1 per cent solution of novocain into the affected joint Following injection pain was relieved and the patient was able to walk easily with no sign of claudication or limp, both of which were present before Pain may return after twenty four hours, when a further injection may be necessary It is urged that treatment should be carried out as early as possible after injury in order to give the best results Injury to the shoulder often leads to progressive loss of function by limitation of the movements of abduction and elevation of the arm Injection into the capsule of the shoulder has given most satisfactory results, with rapid recovery of all movements In cases of injury to the elbow or epicondylitis, which is common in tennis players, local injection has met with great success In one case it was necessary to give three injections, in another, pain which had been present for four months disappeared completely after one injection Treatment has been equally successful in cases of sprain or fracture of the wrist, thumb, or ankle As a result of personal experience this form of treatment is strongly recommended as a method which is simple, free from risk, capable of giving immediate relief and of avoiding the development of grave sequelae Emphasis is laid on the importance of early injection in all cases

159 Glyceryl Trinitrate After Cholecystectomy

J McGowan, W Butsch, and W Walters (*Ann Surg*, December, 1936, p 1013) refer to an apparatus used for measuring changes in pressure in the common bile duct It was found that recurrent attacks of biliary pain following cholecystectomy were associated with an increased intrabiliary pressure as high as 160 mm of water instead of between 0 and 20 mm of water Subcutaneous administration of 1/6 grain of morphine produced an increase in intrabiliary pressure up to 300 mm, and this was accompanied by severe attacks of biliary pain Inhalation of amyl nitrite produced an immediate but transitory relief of pain following a decrease in pressure to zero When 1/100 grain of glyceryl trinitrate (nitroglycerin) was placed under the tongue there was a moderate decrease in pressure and relief of pain five minutes after administration, which lasted for at least an hour Nine cases are reported in which repeated attacks of biliary colic developed after cholecystectomy In these cases injection of morphine sulphate produced pain which was relieved by glyceryl trinitrate or amyl nitrite In two of these cases stones were later found in the common bile duct In two cases biliary colic, which occurred before operation, was relieved by the administration of glyceryl trinitrate No untoward effects were seen except a transitory feeling of warmth, weakness, and tightness in the head The patient should be in a recumbent position when the drug is taken It was found that the tablets made for hypodermic use were more effective than the regular trinitrates It is suggested that the use of morphine may be of value as a diagnostic procedure in the study of patients who have the post cholecystectomy syndrome

POST-INFLUENZAL DEPRESSION

Marked depletion of Vitamin B occurs in all febrile conditions Administration of this Vitamin during convalescence therefore assists the restorative process The B Complex overcomes anorexia promotes nutrition and improves neuritic conditions
Aluzyme supplies the whole of the Vitamin B Complex in active form and is the most reliable agent for the production of these effects In post influenzal depression combination of medium doses of Aluzyme Tablets with the usual tonics is suggested as an effective means of hastening recovery

Therapeutics

160 *Streptococcal Infections in Pulmonary Tuberculosis*

G F CAPUANI (*Ri Patol Clin Tuberc* December 31, 1936, p 886) records his observations on the treatment by prontosil of thirty cases of pulmonary tuberculosis in which the presence of a leucocytosis of about 10,000 indicated the probability of an associated streptococcal infection Two grammes of prontosil were given by mouth for the first six days, and then doses ranging from 1 to 2 grammes according to the tolerance of the patient Capuani came to the conclusion that in patients in the third stage of pulmonary tuberculosis prontosil causes some attenuation of the symptoms of septicaemia owing to its action on the streptococci Its curative action however, is slight or *nil* owing either to the association with other organisms or to the advanced stage of the disease

161 Hyperpiesis

W NONNENBRUCH (*Dtsch med Wschr* January 15, 1937, p 89) is sceptical as to the value of operative intervention with the endocrine system in an attempt to regulate the blood pressure, for the results hitherto achieved in this field have been unconvincing apart from some rare cases of adenoma of the suprarenals Professor Nonnenbruch objects in principle to the conception of a high blood pressure as a nosological unit and he twits certain hydropathic establishments and similar institutions with their weakness for measuring their clinical material more or less exclusively in terms of blood pressures He has often wondered if the gift of blood pressure-recording apparatus to the general practitioner has not on the whole been a bane rather than a boon to his patients Many a subject of hyperpiesis does not really feel ill till he has been bluntly told that he is suffering from it In some cases a high blood pressure may not be morbid and in certain families it may be over 200 mm of mercury for decades without any apparent ill effects In most cases there is no specific means for reducing an apparently too high blood pressure, and it is only by a careful study of the peculiarities of each case that a suitable regime can be devised Relaxation of the nervous system may require drugs, with or without baths and massage But jubilations over the fall in the blood pressure which follows may be misplaced For, in Professor Nonnenbruch's opinion, a high blood pressure is in itself often quite harmless Asceticism in the matter of salt food is to be deplored, although preference should be shown for food containing little salt The same spirit of compromising tolerance should be shown to nicotine, and it may be unwise to deny elderly men with a benign high blood pressure their beloved cigars Gymnastics respiratory exercises and mountaineering may often prove beneficial, and many a hyperpietic feels at his best at a high level

162 *Artificial Hyperthermy*

ALOIS STRASSER (*Wien klin Wschr*, December 11, 1936 p 1522) divides diseases into two categories those which are aggravated by a superadded febrile disease and those which are favourably influenced by the superadded febrile disease To the second category belong certain psychoses articular affections etc The fever may be artificially produced—for example by injection of proteins The effect of the injection is twofold it results in a rise of the body temperature and it produces a focal reaction The rise of the body temperature at first depresses and then increases the basal metabolism The protein injections can therefore be considered as a kind of shock therapy The author then analyses the action of hypothermy produced by physical means Experiments on animals have proved that the biological effects of physically induced hyperthermy are similar to the effects produced by protein injections The author advocates the combination of protein injections with physically induced hyperthermy applied simultaneously with the administration of specific drugs Finally he recommends artificial hyperthermy not only in general paralysis of the insane and tabes but also in rheumatic and articular affections and in neuritis and neuralgia

Dermatology

163 Pemphigus Vegetans

According to E LOMBARDI (*Rif med* November 28 1936, p 1615) pemphigus vegetans occurs more often in females, and may then be combined with pregnancy or ovarian dysfunction, it is most probable however, that it is of infective toxic origin, and that the morbid metabolic and nervous conditions are secondary rather than causal Bacteriological investigations have been inconclusive The *presence in the bullae of pyogenic organisms or B pyocyaneus* is probably due to secondary infection Eberson and others have isolated from anaerobic blood cultures a coccus which is possibly a pleomorphic form of streptococcus Radaeli's bacillus which has been found in the blood and by splenic or bone puncture is a short ciliated organism resembling the diplococci Lombardi's patient, a woman aged 60 became ill after acute stomatitis and pharyngitis, the lesions spread upwards from the external genitalia As is commonly found cultures and animal inoculations from the blood were negative from the bone marrow, however (during life), a *non motile Gram* negative aerobic streptococcus was isolated which was agglutinated by the patient's serum From guinea pigs inoculated in the femur with the marrow the same organism was recoverable, and one of them suffered from cutaneous lesions and a progressive and lethal wasting It is concluded that pemphigus vegetans is an expression of the sensitization of the organism to a toxin frequently that of a streptococcus

164 Lupus and Erysipelas

A A STEIN (*Urol cutan Rev*, January, 1937 p 30) who records five illustrative cases, states that erysipelas is the most frequent and most severe of the complications of lupus *Of 258 patients under treatment at the Lenin*grad Lupusorium in *1931 forty seven developed primary* and eleven secondary erysipelas, observations on whom led to the following conclusions (1) Lupus patients possess a heightened susceptibility to erysipelas (2) Erysipelatous inflammation in lupus patients originates from skin lacerations in consequence of traumatizing measures which serve as portals of entry for infection (3) Erysipelatous inflammation in lupus patients may also arise without any skin trauma, but as a result of biotropism (4) The erysipelas may assume any form or degree of severity, but usually the course is favourable (5) The erysipelatous process does not produce any improvement in the lupus

165 Hormones in Allergic Diseases

F LIPPERT (*Derm Wschr December 26 1936 p 1694*) stresses the importance of the two factors of the allergic constitution—namely, the predisposition of the individual and the noxious agent The last factor however cannot always be ascertained But the reactivity of the organism can be altered in such a way as to decrease its allergic sensitivity The main characteristics of the allergic constitution are an increased permeability of the endothelium and the degeneration and fibrinoid tumefaction of the stroma of the connective tissue These manifestations are the result of a lack of calcium ions in the blood of the allergic individual The author has tried to influence the allergic state by means of a substance called quotientin and his experience with this substance has been uniformly good Quotientin alters the potassium–calcium balance of the blood in favour of calcium It consists of a combination of hormones of parathyroid,

THE RESIDENTIAL TREATMENT OF ALCOHOLISM & DRUG ADDICTION

RENDLESHAM HALL

(Postal Address)—WOODBRIDGE, SUFFOLK

RENDLESHAM HALL—SOUTH VIEW

Rendlesham Hall which is open to receive patients, is essentially a Sanatorium Its daily life and routine are that of an ordinary comfortable holiday or health resort, or of a large country house Each patient has all the privileges of a guest consistent with the prescribed medical treatment

Rendlesham Hall has 45 bedrooms, and about 450 acres of gardens and park It has also a private nine-hole golf course, tennis and croquet lawns, and bowling green

Illustrated booklet giving particulars as to terms, etc, can be had on application to the

adrenals, and hypophysis It is given in intramuscular injections, and is generally well tolerated It has been found particularly useful in the different forms of urticaria

166 Warts of the Feet

V HALBERG (*Hospitalstidende*, December 1, 1936, p 1273) finds that warts of the feet (verrucae plantae) have of late become very common, and that in 1934, at the dermatological department of the Finsen Institute in Copenhagen, 13 6 per cent of all the newcomers suffered from them Of the 677 patients as many as 443 were females, and the average number of warts per patient was considerably higher among them than among the males The scholastic character of this disease was emphasized by the fact that 67 per cent of patients were of school age (6 to 15 years) About half of all the patients were within the narrow age limits of 9 and 13 years There was no girl under the age of 6 years and no man over the age of 70 in this material the oldest patient was a woman aged 81 The author stresses the seriousness of this condition, in which response to trauma sets up a vicious circle, the morbid changes extending under pressure till veritable bursae are formed In one case a wart on the sole of the left foot kept a man for eight years from the enjoyment of walking, gymnastics, and dancing The warts which gave rise to symptoms were invariably situated at points of pressure and a painful wart on the middle of the transverse arch of the sole of the foot was inevitably associated with pes planotransversus if the sole of the shoe was not to blame The author's aetiological association of painful warts with trauma in every case implies that a wart which occurs at a point where there is no pressure requires no treatment, it will disappear of itself Not infrequently an old mother wart existed at a point of pressure surrounded by several recent warts which caused no symptoms, and disappeared of themselves when the mother wart was removed The author correlates the relative frequency of foot warts in women with the high heels and other orthopaedic tortures they endure The treatment at the Finsen Institute was primarily with radium, and relapses were rare

Obstetrics and Gynaecology

167 Hyperprolanuria and Pathological Pregnancy

K HEIM (*Med Welt* December 26, 1936, p 1868) states that although the Aschheim reaction has proved its worth as a diagnostic test for pregnancy in the past ten years the hopes that it might be used quantitatively in the problems of pathological pregnancy have not altogether been fulfilled In cases of hydatidiform mole and chorion epithelioma the values of prolan A and B in the urine may be increased or decreased In hyperemesis gravidarum and other toxaemias of pregnancy hyperprolanuria is the rule When chorion epithelioma occurs apart from pregnancy the quantitative test is of value in estimating recovery and the formation of secondary growths Heim believes that there is an aetiological connexion between hyperprolanaemia and retroplacental haemorrhage, for several cases have been published of haemorrhage in early pregnancy with hyperprolanuria in which at biopsy no hydatidiform mole has been present He has observed the same thing in twelve cases of antepartum haemorrhage with hyperprolanuria In twenty-five cases of eclampsia hyperprolanuria was present The amount of prolan excreted must be estimated in relation to the amount of urine excreted, whether this be normal or diminished and highly concentrated In the latter case prolan may be found in citrated blood and cerebro-spinal fluid The source of prolan production is the placenta, and a definite ratio between the quantity of prolan excreted and the placental mass has been proved in multiple births

168 Caesarean Section in Tuberculosis

R SCHWARCZ (*Sem méd*, B Aires, December 17, 1936, p 1706) records his observations on forty one cases in which Caesarean operation was performed in subjects of pulmonary tuberculosis with the following results In thirteen (32 per cent) there was an aggravation of the pulmonary lesions With the exception of one patient in the third stage of pulmonary tuberculosis all were in the first or second stage, and four died In sixteen patients (39 per cent) the operation was followed by improvement and in twelve (20 per cent) no change took place Schwarcz comes to the conclusion that the only indications for Caesarean operation in tuberculous women are of an obstetrical nature In all other circumstances Caesarean section is not only of doubtful benefit to the patient but may be actually dangerous

Pathology

169 Endemic Dysentery and Diarrhoea

G F MCGINNIS A L MCLEAN, F SPINDLE and K F MANCY (*Amer J Hyg* November, 1936, p 552) report an interesting field and laboratory study of endemic dysentery and diarrhoea during the years 1930–33 in Henrico County, Virginia During this time 295 cases were studied, of which 141 were classified clinically as dysentery and 154 as diarrhoea, though the distinction between the two was often arbitrary The highest incidence occurred during July and August The 1 to 4 age group was most severely affected Bacteriologically organisms of the Shiga type were never found Flexner bacilli were isolated from sixty-four of the dysentery and forty-five of the diarrhoea patients, Sonne bacilli were isolated from thirty four of the dysentery and eighteen of the diarrhoea patients That is to say, dysentery bacilli were demonstrated in about 70 per cent of the dysentery and 40 per cent of the diarrhoea cases, the Flexner bacillus accounting for about two-thirds and the Sonne bacillus for about one third of the infections During the inquiry faecal specimens were obtained from 625 healthy contacts No fewer than 110 of these—that is, 17 6 per cent—were infected with dysentery bacilli—93 with the Flexner and 17 with the Sonne type Carriers were frequent at all ages

170 Vaccination Against Yellow Fever

A W SELLARDS and J LAIGRET (*Arch Inst Pasteur Tunis*, 1936, Nos 3 and 4 p 424) summarize the evidence in favour of the use of a living neurotropic mouse strain of virus for the vaccination of human beings against yellow fever Observations on two vaccinated subjects showed that their blood serum before vaccination contained no demonstrable antibodies when examined by the mouse and the monkey protection tests, but that after vaccination antibodies were demonstrable by both methods Confirmation of this indirect proof of immunity was sought by a more direct method A subject whose blood was free from antibodies was vaccinated Antibodies appeared in his blood serum Seven months later he submitted himself voluntarily to being bitten by four presumably infected mosquitos (*Aedes aegypti*) Three control monkeys were bitten the following day each by one of the same mosquitos (one mosquito had died overnight) Two of the monkeys contracted yellow fever and died in six to seven days, the third monkey died a fortnight later without evidence of the disease Two of the mosquitos were therefore certainly infected The vaccinated human subject remained perfectly well In Africa about 20,000 human beings have now received the vaccine and in spite of the exposure of some of them to infection not one has yet contracted yellow fever It is concluded that the evidence in favour of the innocuity and the protective value of the vaccine is sufficient to justify its general extension though it is admitted that no adequate statistical proof of its efficacy is yet available

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS
NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF LINLITHGOW C.M.G., A.D.C.

Medical Superintendent DANIEL F. RAMBAUT M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged Immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombieres treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra-Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation Therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

COURT HALL, KENTON, near EXETER,
for the treatment of eight Ladies, voluntary, temporary, or certified patients
Large gardens and own dairy

CLIFFDEN, TEIGNMOUTH, for early and convalescent cases. A well appointed house with spacious balconies and extensive views of the South Devon Coast. Sub-tropical gardens, own dairy in 25 acres. Private road to beach.

Resident Physicians: BERTHA M. MULES, M.D., B.S.; ANNE S. MULES, M.R.C.S., L.R.C.P.

Telephones: Starcross 59, Teignmouth 289

NORTHUMBERLAND HOUSE,
GREEN LANES, FINSBURY PARK, N.4

A PRIVATE HOSPITAL for the treatment of mental and nervous illnesses. Conveniently situated and easy of access from all parts. Six acres of ground, highly situated facing Finsbury Park. Voluntary and Temporary Patients received without certification. Occupational Therapy, Psychotherapy, and other modern forms of treatment.

Telephone: STAMFORD HILL 2688. Telegrams: SUBSIDIARY, LONDON.

Convalescent Home, KEARSNEY COURT, DOVER. For further particulars, apply to the Medical Superintendent.

THE COPPICE, NOTTINGHAM.
HOSPITAL FOR MENTAL DISEASES

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Occupational Therapy. Voluntary and Temporary Patients received. *Tel.* 64117. *For terms, etc., apply to the Medical Superintendent.*

HAYDOCK LODGE.
NEWTON-LE-WILLOWS, LANCASHIRE.

Telegr. Street, Ashton-in-Makerfield. *Phone* Ashton-in-Makerfield 7311.

For the reception and treatment of PRIVATE PATIENTS of both sexes of the UPPER AND MIDDLE CLASSES suffering from mental and nervous diseases, either voluntarily, temporarily, or under Certificate. Patients are classified in separate buildings according to their mental condition.

Situated in park and grounds of 400 acres. Self-supported by its own farm and gardens in which patients are encouraged to occupy themselves. Every facility for indoor and outdoor recreation. For terms, pro spectus, etc., apply MEDICAL SUPERINTENDENT.

BARNWOOD HOUSE
GLOUCESTER

A REGISTERED HOSPITAL for the CARE and TREATMENT OF LADIES and GENTLEMEN suffering from NERVOUS and MENTAL DISORDERS. Within two miles of the G.W.Ry. and L.M. & S. Railway Stations at Gloucester, the Hospital is easily accessible by rail from London and all parts of the United Kingdom. It is beautifully situated at the foot of the Cotswold Hills and stands in its own grounds of over 300 acres. Voluntary Patients of both sexes are also received for treatment.

Special accommodation for Lady Voluntary Patients is also provided at the MANOR HOUSE, which has its own private grounds and is entirely separate from the Main Hospital.

For particulars as to terms, etc., apply to—ARTHUR TOWNSEND, M.D., Medical Supt.

Telephone: No. 6207 Barnwood.

HILL END HOSPITAL
FOR MENTAL AND NERVOUS DISORDERS
(20 miles from London)

Ladies suffering from all forms of MENTAL ILLNESS are received for treatment on modern lines as Voluntary, Temporary or Certified Private Patients at the Hill End Hospital. Convalescent or mild cases can be treated in a delightful country mansion with extensive grounds known as

HIGHFIELD HALL,

situate about a mile away from the Hospital. FEES: TWO TO THREE GUINEAS PER WEEK.

For further particulars apply to the Medical Supt., W. J. T. KIMBER, L.R.C.P., D.P.M.

ST. ALBANS, HERTS

FENSTANTON,
CHRISTCHURCH ROAD,
STREATHAM HILL, S.W.2

A Private Home for the Care and Treatment of a limited number of Ladies with Mental and Nervous Disorders. Certified, Voluntary, and Temporary Patients received. Large Mansion with 12 acres of grounds. (See *Medical Directory*, p. 2312.) Apply Resident Physician. *Telephone* Tulse Hill 7181.

HOME FOR EPILEPTICS

The Sun shines all the year round in SOUTH AFRICA

SUNSHINE fresh air and rest is a prescription that can always be filled in South Africa. And not the half hearted sunshine that makes a pretence of warming Europe in Winter but a full bodied lively sunshine that sends the blood coursing through the veins

For those who stand in need of such treatment South Africa possesses several excellent radio active springs situated in resorts which provide excellent accommodation and more than a little amusement to banish tedium and depression

The voyage to South Africa is in itself a delightful melange of rest cure and tonic—providing three weeks of complete relaxation amid the warm yet bracing sea breezes of the sunny Southern Atlantic

A booklet Medicinal Springs of South Africa gives detailed information and analysis of medical waters in various parts of the country Write to South African Railways Tourist Bureau South Africa House London W C 2

PROVIDES HIGHLY SUCCESSFUL ORAL AND POSTAL COACHING FOR ALL MEDICAL EXAMINATIONS

Special Preparations for all Surgical Qualifications

F R C S ENGLAND (Primary & Final) M C CANTAB M S LONDON F R C S EDINBURGH

And all other Surgical Degrees and Diplomas.

¶ The remarkable success of Students of the Medical Correspondence College at the higher Surgical Examinations is specially noteworthy.

¶ Both at the Primary and Final F R C S England the majority of our Students are successful at the first attempt and candidates who have failed at these Examinations on several previous occasions get through without difficulty after going through our courses.

¶ The Surgical Tutors of the College all hold either the M S Lond or F R C S England or both and are highly experienced teachers

¶ The Postal Course are thoroughly clear concise and up to date and the test questions are carefully selected from those set at previous Examinations so as to embrace all parts of the subject By working systematically through the Course the Student is brought up to the examination standard in the minimum time and much unnecessary reading is saved

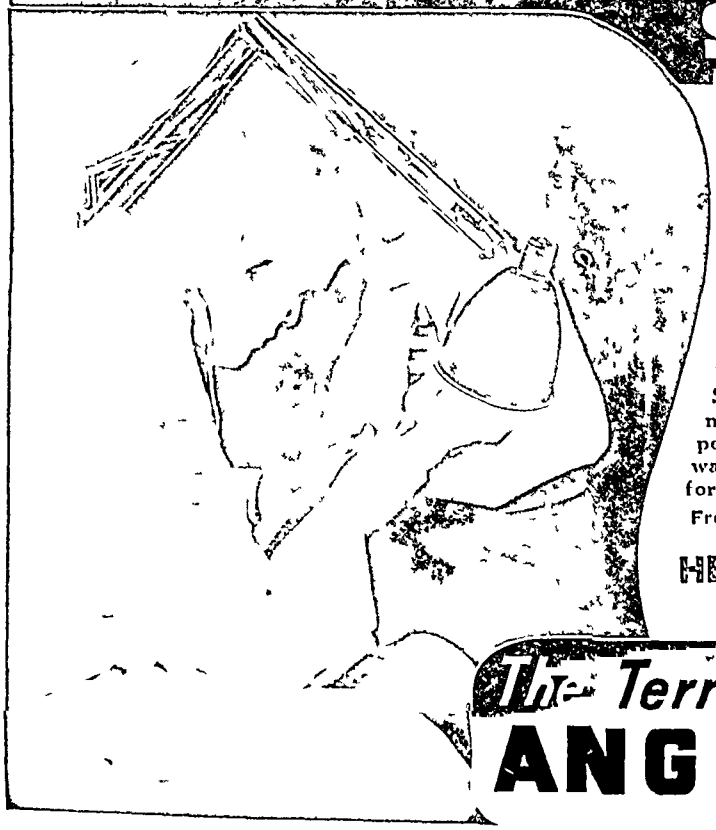
BRINGING THEM BACK ALIVE...

from the Autoclave

Time and time again they do it Even after enough sterilization to put an end to many brands of rubber gloves, Seamless Standard Latex Surgeons' Gloves come back alive and elastic

While you are getting this extra wear, you have the fine operating features of greater thinness and tactility Your touch is delicate and sensitive—yet the friction is there for a firm grip Fingers are free—never cramped In short, you virtually forget you have gloves on



Test these remarkable gloves yourself Try on a pair Wet them Note the firmness with which you can grasp and manipulate instruments Test their strength at the wrist, and note the uniformity of the tissue thinness of the fingers

Try these famous gloves—the finest money can buy Made by the manufacturers of the famous *Maderite* Surgeons' Gloves, unequalled at their price

dissatisfied because it has been told that its procedure has no validity Everyone concerned is therefore dissatisfied and in this respect the decision must surely be unique There is also the question whether the Minister or his advisers are satisfied with the decision but this must remain a matter of conjecture

General Medical Service in Ayrshire

The following particulars with regard to the general medical service in Ayrshire were given in the course of an address to the Scottish Association of Insurance Committees by the clerk to the Ayrshire County Insurance Committee who speaking in support of the recommendations of the Departmental Committee on Scottish Health Services particularly in regard to the treatment of dependants of insured persons said that the committee had unknown to themselves stated not opinions but facts which had been proved

At the beginning of last year the Branch in Ayrshire of the British Medical Association started a general medical service The object was to provide the dependants of insured persons and others whose incomes do not exceed £250 per annum with a medical service similar to the insurance medical service and with drugs and appliances also A weekly contribution is charged the amount (4d 8d 10d or 1s) depending upon the number of dependants or persons to be attended and treated The contributions may be reduced and are reduced in many areas to unemployed subscribers the amount charged being 4½d per week per family where the subscriber is entitled to medical benefit under the Insurance Act and 7d per week when he is not entitled In the districts in which the service operates there are 56 per cent of the population of the county Many of the remaining 44 per cent are in districts which are entirely rural or residential or in mining and industrial areas where there are already colliery and works medical schemes There are 9 700 subscribers who pay in respect of over 11 000 adults and 14 000 children a total of over 25 000 persons for whose treatment the members of the service—that is the doctors—are responsible There are slightly more than two dependants for each subscriber The Departmental Committee's report gives 1 900 000 as the number of insured persons in Scotland entitled to medical benefit and 1 600 000 as the number of dependants who would be brought in by an extension of medical benefit to dependants If these figures are correct it is clear that it is the men and women with more than the average number of dependants who have become subscribers That means that the man with a family is anxious about the health of his wife and children is eager to take advantage of a scheme which will save him doctors bills and is prepared to pay considerably more than he would need to pay for a similar service provided nationally

The insured population and persons under the scheme are 53 per cent of the population in the districts in which the service operates The Departmental Committee estimates that the 1 900 000 insured persons and the 1 600 000 dependants represent about 70 per cent of the population—that is only 17 per cent more than are now under a scheme of a purely voluntary nature There could not be a stronger argument than these figures that insured persons want a medical service for their dependants and are prepared to pay for it The committee would appear to underestimate the cost With a voluntary scheme the expenses of administration which include weekly collection and the keeping of an account for each subscriber are necessarily heavy These would in the main be absent in a national scheme The attitude of the unemployed to the medical service has been very interesting and significant Of the 9 700 subscribers 26·5 per cent are unemployed That is conclusive proof that the choice of doctor is valued Rather than ask for treatment by the public assistance medical officer these unemployed prefer to pay for and choose their own doctor Figures are available of persons under the scheme who are not insured persons—small tradesmen and others—who would come under the proposed Contributory Pensions Bill They number 1 478 of the subscribers—1 698 adults and 778 children a total of 2 476 or 9·9 per cent of the persons for whose treatment the doctors are responsible That supports the contention that medical benefit should be provided for these persons They evidently want it and are prepared to pay for it

Medical Service in Glasgow

At the December meeting of the Glasgow Insurance Committee there was submitted a letter from the Department of Health intimating that the Department had agreed to adopt the recommendation of the Insurance Committee to withhold the sum of £100 from fees due to a practitioner in respect of the failure by the practitioner to comply with his Terms of Service The Department drew attention to several cases of neglect of patients on the part of insurance practitioners and referred to such cases as reflecting on the national health insurance medical service It requested that a copy of the letter be sent to the Panel Committee The clerk reported that he had forwarded a copy of the letter to the Panel Committee and as requested by that committee had supplied it with a statement showing the number of cases considered by the Medical Service Subcommittee during the last ten years with the decisions arrived at

The Panel Committee stated that it had analysed the number of cases considered by the Medical Service Subcommittee during the last ten years and was definitely of the opinion that they do not disclose a state of affairs in any way justifying adverse criticism The cases referred to by the Department were serious but they were seriously dealt with and substantial penalties were imposed The fact that these complaints came closely together in point of time is an exceptional circumstance which has no necessary bearing on the standard of medical service in the city The Panel Committee considers that the medical service in Glasgow compares quite well with that of any area in the country

The Insurance Committee concurred in the observations of the Panel Committee on the letter from the Department of Health and decided that a reply should be sent to the Department stating that the facts do not appear to justify the observations of the Department and that in the opinion of the committee there is no necessity for the Department of Health to be perturbed regarding the national health insurance medical service in Glasgow

GENERAL MEDICAL COUNCIL EXECUTIVE

Indian Diplomas.—At the last meeting of the Executive Committee of the General Medical Council it was reported that the effect of a resolution by the committee at its previous meeting in May resuming the recognition of the degrees granted by the universities of Bombay and Lucknow had the effect of reviving the condition originally attached to such recognition by the committee in 1922 and 1923 that a certificate must be given by the dean of the faculty of medicine that the holder of a degree had fulfilled the requirements of the General Medical Council This had led to some correspondence with the Medical Council of India which assured the General Medical Council that inclusion in the lists of graduates of universities whose degrees had been approved by the Medical Council of India would be a guarantee that the graduates so included had satisfied the specific requirements On this understanding the Executive Committee agreed to rescind so much of its previous resolution as required such certificates to be given by the deans of the faculties

Central Midwives Board—The amendment of the rule of the Central Midwives Board whereby fourteen days is substituted for ten days as the period after labour during which the midwife must personally supervise the mother and child had been submitted to the President of the Council, and the committee approved a reply which he had sent to the effect that the committee did not desire to make any representations on the amendment

King Edward VII College of Medicine Singapore—The committee had before it a report from the director of medical services Straits Settlements indicating the steps which had been taken to give effect to the recommendations and suggestions made by the Council's visitor, Sir Richard Needham, in 1934 Sir Richard Needham in commenting on the report, stated that most satisfactory advances had evidently been made in the teaching organization in public health and ophthalmology In pharmacology and therapeutics there had been no advance on the position two years ago, but it was proposed in 1937 to appoint a separate part-time lecturer in these subjects The question of adopting a policy to concentrate the teaching clinics in medicine and surgery at the general hospital had advanced to the stage of being considered by a Government Committee Another important question of policy concerned the provision of an adequate and effective out-patient department as an organized link in the chain of medical education Any progress with regard to this provision was held up pending completion of the building of a new dental hospital, expected to be started during 1936

THE B.M.A AND PUBLIC HEALTH

Among the various matters of interest which came before the Public Health Committee of the Association at its December meeting was the question which has arisen in a Yorkshire town where the town clerk has given a special interpretation to the requirement that members of the local council shall not be present when matters which may be of pecuniary interest to them come under consideration At the instance of the town clerk the council has passed a resolution that no member should be present "during the consideration by any committee or sub committee of any matter in which he is by himself or by his partner pecuniarily interested or in which he is by himself or his partner professionally acting for any party concerned" A member of the Association who is a member of the town council protested against this rule pointing out that, for example, the medical officer of health's report on infectious diseases might come up for consideration at a time when he (the doctor) was attending a case and might be said to be professionally acting for the case The town clerk, however said that he had no such situation in mind, what he was intent on guarding against was for example an estate agent, a member of the council, being present when a proposition to buy land was under discussion when the result might be, if he informed his clients, to increase the price of land to the detriment of the council The answer to that is, of course, that while the town clerk might be inclined to put a reasonable construction on the resolution he could not bind his successor or the council The Ministry states that it has no authority to prevent a local council from passing any standing order it pleases as to whether a standing order is *ultra vires* is a matter for legal contention The section of the Act (Section 76 of the Local Government Act 1933) lays stress on 'pecuniary interest," which is obviously the governing principle The issue is confused by the use of the word professional" It was agreed to adhere to advice already given to the member in Yorkshire who had raised the question

Fees for Practitioners Called in by Midwives

The issue by the Ministry of the Medical Practitioners (Fees) Regulations, being the scale of fees for practitioners called in on the advice of midwives, raised some question Some time ago a deputation from the Association discussed with officials of the Ministry the proposals for modifying the scale of fees—proposals which eventually came before the last Annual Representative Meeting—and a promise was given on the part of the Ministry that when the detailed request for modifications was received from the Association it would be considered after it had been submitted to the associations of local authorities for their observations While the matter was still under consideration however the Ministry had issued the new regulations The reply of the Ministry was to the effect that it was by inadvertence that the Association was not informed when these regulations were issued that they had been made without prejudice to the due consideration of any proposals which might be submitted for a revision of the scale, and that careful consideration would be given to the proposals A deputation was appointed to discuss with the Ministry the resolutions of the last Annual Representative Meeting on this subject

Local Government Officers' Superannuation

It was intimated in the Speech from the Throne at the opening of Parliament that legislation would be submitted to make further provision for the superannuation of local government officers and it has been explained that the main object of the Bill would be to remove the bar to mobility to which the absence of a superannuation system gives rise When a Superannuation Bill was proposed in 1935 the Medical Secretary was asked to arrange for an amendment to be tabled to provide that medical officers employed by local authorities should be entitled to 'added years of service' for the purpose of super-

ROYAL AIR FORCE MEDICAL SERVICE

Applications are invited from medical men for appointment to commissions in the Medical Branch of the Royal Air Force for entry in May 1937

Candidates must be of pure European descent They must be British Subjects, the sons of British Subjects and registered under the Medical Acts

SOUTH LONDON HOSPITAL FOR WOMEN, Clapham Common, S W 4

OPHTHALMIC DEPARTMENT

Applications are invited from fully qualified Medical Women as SENIOR CLINICAL ASSISTANT on Monday mornings at 9 Applicants with testimonials, to be sent to the Secretary at the Hospital

CONTROL WHOOPING COUGH

THE advance in vaccine therapy represented by Dissolved Vaccines G L is of special significance in the prophylaxis and treatment of whooping cough It is known that the most satisfactory immunity to whooping cough is obtained by giving large doses at short intervals

In Dissolved Vaccines G L the antigens are in solution and detoxicated Thus (1) when injected, an immediate antibody response can be produced, (2) high doses can be administered without risk of undesirable reaction A large volume of clinical evidence, covering the past three years, shows that the incidence and course of whooping cough can now be successfully controlled by the use of the Whooping Cough Dissolved Vaccine G L

Prophylaxis

Over 2 years 3 injections—first 0 5cc succeeding dose 1 cc each
Under 2 years 3 injections—first 0 25cc succeeding doses 0 5 cc each
At 3 to 5 days intervals If there has been exposure to infection first two doses should be given on successive days

Treatment

Over 2 years 3 or 4 injections First day 0 25 cc second day 0 5 c then 1 cc at 3 day intervals

Under 2 years 3 or 4 injections Two doses of 0 25 cc, and two doses of 0 5 cc at the same intervals as above

annuation in consideration of peculiar professional qualifications or of special circumstances

The chairman of the Committee reported that he with Dr G F Buchan and the Deputy Medical Secretary had attended at the Ministry to present the various resolutions on the subject which the Council had adopted and he thought that these were received with interest and some sympathy The question of interchangeability as between municipal and voluntary hospitals by the adoption of some form of reciprocal superannuation was beset with many financial difficulties but the matter was regarded as important from the point of view of efficiency of public health services

Clinical Work for Local Authorities

The resolution of the last Annual Representative Meeting deprecating the increasing tendency for the employment by municipal authorities of part time and salaried medical officers not engaged in private practice for the performance of clinical work within the private practice sphere led to some debate in the Committee The view was strongly expressed that instead of making repeated protests in individual instances the Association should endeavour to develop a policy in accord with the trend of the time and also with its own principles which had been so often stated As one member put it what were wanted were positive proposals rather than objections to past occurrences With this in view it was agreed to refer the resolution to the Health Services Committee which is at present considering the report of the Scottish Departmental Committee along with proposals which the Association made six years ago and embodied in *A General Medical Service for the Nation* Before this subject was dismissed one member of the Committee a medical officer of health said that in his experience there was a great reluctance on the part of private practitioners to undertake part time work He could not agree with a suggestion that the reason might be because the hours when they were expected to be on duty conflicted with ordinary surgery hours

The Committee also considered the circular (1550) issued some time ago by the Ministry of Health to maternity and child welfare authorities on the subject of children under school age in which great stress was laid on the work of health visitors It was felt that the circular disregarded some rather important facts in public health administration and gave an impression that successful maternity and child welfare work depended most of all on health visitors It was decided to take this matter up with the Ministry

Various Business

Representatives of the British Medical Association and of the Society of Medical Officers of Health have been advising the British Dental Association in regard to the salary scales of public dental officers and a report was made to the Committee of a conference on this subject In the scale which is to be suggested to the associations of local authorities there are three grades of dental officers proposed assistant dental officers working under the direction of a senior dental officer with a salary of £450 proceeding by increments of £25 to £700 single handed dental officers with a salary of £600 proceeding by the same increments to £800 and senior dental officers at a variable minimum from £700 upwards

A suggestion was made that to the memorandum on the remuneration of medical practitioners employed part time by local authorities which was approved by the last Annual Representative Meeting the following note should be added

> The annual salary for an appointment under this scale which involves some variability in the weekly number of attendances should be based on the estimated average number of weekly attendances during the year The arrangement of sessions should provide for reasonable uniformity of duty each week but if this is impracticable the salary should be based on their estimated average duration

After some discussion this was approved with the omission of the last clause the words after duration The Committee agreed to transmit to the Ministry of Health the resolution of the Section of Public Health at the last Annual Meeting with regard to the proposal of the sale of shellfish which had not been certified having been cleansed by the recognized method at an approved station

A report was made on amendments for which it proposed to press in the Maternity Services (Scotland) Bill which still come up for second reading shortly

The Committee made its usual examination of various public health appointments on which questions as to salary or conditions had arisen

HOSPITAL POLICY

The Hospitals Committee of the Association met on December 16 1936 when among other matters it had before it a report of conferences which the Committee had had with representatives of other bodies on matters of hospital interest Dr Parkinson the chairman of the Committee had presided over both of them The first was a conference with representatives of the British Hospitals Association the Council of Voluntary Hospitals Contributors' Association and the Association of Municipal Corporations on the implications in the House of Lords judgment in the case of Lindsay C C v Marshall The second proposed the formation of a subcommittee to take counsel's opinion on certain points arising out of this and other legal decisions with a view to considering the desirability of drawing up a scheme for the pooling of hospital authorities and their other property The general feeling was that the uncertainty should be cleared up as soon as possible and the Committee endorsed the opinion of the conference and recommended to the Council that the British Medical Association should bear its share of expenses in connection with the action proposed

The interim committee on provident dispensaries includes representatives not only of the British Hospitals Association but also of the Hospital Saving Association the large provident associations and the Hospitals Association reported that it was now proposed that a central co ordinating body of provident associations should be established and that a draft scheme for its constitution should be prepared such constitution to provide for the inclusion only of those schemes which did not differ materially from the model scheme of the British Medical Association A further suggestion was that the British Medical Association should be asked to make a payment in advance to cover the necessary preliminary expenses such amount to be repaid as funds became available The desirability of having a body of this kind in close relationship to the Association so ensuring that the interests of the service were likely to be acceptable to the profession was recognized and the Hospitals Committee agreed to the general principle of the interim committee's proposals and to recommend to the Council that the advance be made

The third matter which had been under discussion with an outside body was the salaries of whole time assistant radiologists at hospitals Representatives of the Committee had met representatives of radiological societies on this subject In the course of some discussion a member stated that in one hospital the part time radiologists were being paid [illegible] over their views on the [illegible] general the [illegible] of economy to the [illegible] radiologists It was [illegible] of whole time assistant radiologists Radiologists Group Committee of the Association

Junior Resident Medical Officers

The Committee further considered the terms and conditions of employment of junior resident medical officers in hospitals One question which had been left over from

a previous discussion was the entitlement or non-entitlement of such officers to charge fees for such medical reports and certificates as they were permitted to give by the responsible medical officer The difference in procedure as between voluntary hospitals and municipal hospitals was mentioned, but the Committee endeavoured to frame a principle which should be applicable to both, the two classes of hospital tending to approximate in this as in other respects Eventually, after a rather technical discussion, in which the view was strongly urged that it was important that the governing body should lay down who should and should not give these certificates, the Committee agreed upon a form of resolution that the responsibility of the senior and junior resident medical staff for giving certificates and medical reports and their entitlement or non entitlement to retain fees for them should be clearly defined in the hospital rules, that resident medical officers should be permitted to issue certificates and reports which are required for legal purposes under the general authority only of the responsible medical officer, and that copies of all such certificates and reports should be retained in the hospital records A statement was further agreed to as a footnote that it was customary for resident medical officers to be permitted to charge fees for such medical reports and certificates as they were permitted to give by the responsible medical officer

On another point in these terms and conditions of employment of junior officers a member of the Committee urged that it should be made a condition of appointment that resident medical officers should be members of one of the medical defence societies, and this was the general view of the Committee It was pointed out that many hospitals already insisted on this condition

Staffing of Council Hospitals

A document prepared by the Medical Superintendents Society on the future of local authority hospitals had been previously before the Committee The Hospitals Committee had found itself in agreement with the general trend of the memorandum without committing itself to any particular statement of view, but had made certain observations, and the memorandum was now returned by the society with its comments on the points to which the Committee had drawn attention On one point the society after laying down the qualifications of a medical superintendent, stated that he should be in administrative control of the hospital and directly responsible to the public authority for its government The Committee in reply had drawn attention to the position of the medical officer of health in regard to the proper administration of the various medical institutions of the local authority It remained, however, the unanimous opinion of the Medical Superintendents' Society that the medical superintendent should be directly responsible to the public authority for the hospital under his control While it was recognized that the medical officer of health must be the chief adviser to the local authority on health services the medical superintendent should have direct access to the council or to the appropriate committee

In a general way, however, the society had accepted the Committee s comments The Committee accepted no responsibility on behalf of the Association for the document, but expressed its appreciation of the opportunity afforded it of considering the views of the Medical Superintendents' Society on the important question of the future of local authority hospitals

Contributory Schemes

The Committee devoted attention to the model contributory scheme adopted at the last annual meeting of the British Hospitals Contributory Schemes Association, also a draft document embodying the principles of a model contributory scheme prepared by the secretary of the Merseyside Hospitals Council for consideration by the former body

The chairman of the Committee (Dr Peter Macdonald) had prepared a memorandum of comment in which he pointed out that both these documents regarded contributory schemes as established and run in the interests of voluntary hospitals and separate schemes as run in the interests of a particular voluntary hospital or hospitals These views, the memorandum proceeded were mistaken ones The primary object of a contributory scheme was the hospital interest of its members—namely, full payment of in-patient costs on admission to a hospital or of out patient costs where a member was unable to obtain such out-patient treatment elsewhere at fees he could reasonably afford, such out-patient treatment was to be consultative treatment only except for occasional specialist treatment, and, finally, the payment of the cost of ancillary services was also to be regarded as one of the objects of the scheme It was further pointed out in the memorandum that a disadvantage of the restriction of contributory schemes to voluntary hospitals was the non payment or unsatisfactory payment of municipal hospital costs, also that a disadvantage of the connecting up of a contributory scheme with one hospital or one group of hospitals was the cumbrous procedure needed to secure what was called reciprocity

One member mentioned that in his area a hospital contributory scheme had been launched and found itself with an abundance of surplus money Thereupon the hospitals said in effect, "You can hand over to us a substantial amount in addition to the full overhead charges for patients" But the money had in fact been raised for hospital benefits for the contributors He had asked those concerned whether it had occurred to them if they had money to spare that the members of the medical profession were entitled to some recompense, some of the hospitals to which the patients were sent having no staff fund at all, and that point of view had evidently not been taken

The Association has its own model scheme, which the Committee saw no reason to vary It was agreed to send to those responsible for the two documents referred to above a memorandum on the lines of the sketch prepared by the chairman, pointing out what the Committee regarded as the general purpose of contributory schemes

Other Business

Attention was drawn to the first annual report of the Manchester Joint Hospital Advisory Board, one of the honorary secretaries of which is Mr R L Newell, a member of the Hospitals Committee Mr Newell said that the formation of this Board, the purpose of which was to ensure the maximum co operation and co-ordination between the city council and the voluntary hospitals organization, had been followed by most gratifying results At all the meetings no signs of partisanship had become evident Mr Newell was congratulated by the chairman and his fellow members on what had been achieved in Manchester

The Committee gave further consideration to the question of the superannuation rights of hospital staffs on transfer, and Professor Picken reported that he and other representatives of the Public Health Committee had met officers of the Ministry in view of the Local Government (Superannuation) Bill which is shortly to be introduced The case for entitlement to "added years of service" in consideration of peculiar professional qualifications or special circumstances had been pressed, also the need for uniformity in the superannuation schemes of local authorities, and provision for interchangeability of superannuation as between voluntary and council hospitals On this question of interchangeability the Ministry had emphasized the extreme difficulties mentioned in the report of the Lancet Commission on Nursing in 1932, but had agreed to consider carefully whether any sort of transfer value could be created

Matters of dispute between hospitals or members of their medical staffs always occupy some of the time of the Committee In one dispute between hospitals of con-

MARMITE

as an aid to

Correct Nutrition

Adequate nutrition must play an important part in the Fitter Britain Campaign The nation must be properly fed before any system of physical training can be effective

Injudicious choice of food appears to be only too common and no section of the community is immune to the disastrous consequences of malnutrition

Physicians prescribe Marmite as a routine measure because they appreciate its intrinsic worth as a dietary adjunct and on account of the abundant evidence which exists of its prophylactic and therapeutic value

MARMITE

(YEAST EXTRACT)

for its content of vitamin B_1 and the B_2 complex

and for its anti-anaemic properties

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza, the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci, in addition to other organisms incriminated in the causation of coryza and influenzal infections It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the brochure will gladly be supplied to any physician on request

★ for the PALE CHILD

A palatable, odourless, almost tasteless form of iron

In variable weather, it is especially important to raise the tone and vigour of the pale child by increasing the haemoglobin and red blood cell content of the blood Between the pressure of school work and play and the discomfort of changing temperatures the anaemic child urgently needs blood recuperation and invigoration Only iron can do that but it must be in a form which a capricious child will take willingly

Ovoferrin meets the needs of the blood hungry child Palatable odourless and almost tasteless children take Ovoferrin gladly whereas they rebel at the nauseating irritating organic salts Ovoferrin is noted as a rapid and certain builder of haemoglobin and red blood cells It stimulates the jaded appetite it does not constipate it does not stain the teeth and it is retained by the most sensitive stomach The dose for children is one or two teaspoonfuls in milk or water with meals Each tablespoonful, the adult dose, contains one grain of easily assimilable metallic iron in colloidal form held in this state by means of a protective protein colloid Ovoferrin is prescribed in 11 ounce bottles Trial bottle on request

Spencer Sacro-iliac Support gives the patient beautiful style lines while serving the doctor's purpose with the utmost efficiency

A Simple and *Light* Sacro-iliac Support

A simple band and pad incorporated in a light-weight flexible corset which remains in place is the SPENCER way of meeting the doctor's *need for* efficient sacro-iliac support

Only by designing a garment to the *individual figure needs* (as Spencer designers do) is it possible to evolve a simple design with each section of the garment planned to give maximum figure support In a Spencer the weight of support is placed on the pelvic girdle—not on the spine at or above, the lumbar region

No cumbersome straps and laces at the back of the garment are necessary in a Spencer Sacro iliac Support The Spencer is easy to adjust, inconspicuous and is *welcomed* instead of *objected to* by the well groomed woman or man Spencer support is a matter of DESIGN—not bulk

Trained Spencer Corsetieres are resident throughout the Kingdom Name of nearest gladly supplied on request

A scientifically trained Spencer Corsetiere will call at your surgery or at your patient's home to take measurements under your supervision

Spencer Supports and Corsets are never sold in shops.

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non narcotic analgesics available Too often however its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available

Alasil provides the beneficial therapeutic effects of pure acetyl salicylic acid in such a form that it is acceptable even by disordered digestions This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with Alocol a potent gastric sedative and antacid

Since Alasil is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter

Alasil is therefore an analgesic antipyretic and antirheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated

MULTIVITE

Vitamins A and D with Vitamin C and Vitamin B Complex

Multivite, which contains within the compass of a small pellet the essential Vitamins A and D with Vitamin C and the Vitamin B complex, fills the need for a comprehensive medicament for administration in conditions of debility and general subnormal health and other familiar manifestations of an all round vitamin deficiency which prevails as a result of modern sophistication of foods

Multivite Pellets are specially designed for their suitability in use by adults, children however, do not find them unpalatable even when eaten as a sweetmeat

Multivite Pellets are packed in containers of sixty, suitable for carrying in the pocket or handbag

MIL-SAN

the scientific contraceptive

MIL SAN is a bland non injurious spermicidal jelly independent of variable physiological conditions of moisture or temperature Since there is nothing to melt, dissolve or foam MIL SAN is immediately effective

The formula of MIL SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina Its spermicidal efficiency is due to (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices forming a chemical barrier preventing the penetration of spermatozoa into the os uteri

The method of applying the jelly is simple hygienic, and proof against carelessness Each application of 7 c.c. is contained in a specially made strong glass tube sealed at one end with a cork at the other by a hard wax plug In use the cork is removed a bulb fitted behind the wax plug and the tube inserted Compression of the bulb forces the wax plug down the tube and ejects the contents The empty tube which is thrown away proves the application and ensures the quantity There is nothing to fill nothing to clean Each application is hygienic and complete

MIL SAN does not deteriorate and is not affected by climatic conditions

Literature setting out the ingredients and full particulars together with a box of specimen tubes for examination are sent on request to members of the medical profession

HOW IMPORTANT
ARE MINERALS IN THE DIET?

They are absolutely essential for the maintenance of an adequate state of nutrition. However, not infrequently an apparently minor mineral deficiency may weaken the body's defensive mechanism to such a point that

Pregnancy, Infection, or any other unusual tax

may lead to a prolonged period of convalescence.

COMPOUND SYRUP OF HYPOPHOSPHITES

ACRIFLAVINE 'B.D.'

Acriflavine 'B D', the first acriflavine made in Great Britain, was used originally in the treatment of wounds, but as a result of extended investigation it has become the most widely used of all antiseptics in surgery and in medicine

In surgery, as, for example, in ophthalmic work and, generally, as an effective bactericidal antiseptic, its use is becoming a matter of routine

In medicine, Acriflavine 'B D' is prescribed in the treatment of gonorrhœa and in such local septic conditions as eczema, impetigo, pediculosis, scabies, pyoderma, sycosis barbae, folliculitis, pemphigus neonatorum, ulcus molle and impetigo contagiosa, such general local affections as otitis externa and tonsillitis likewise yield to treatment with Acriflavine 'B D'

Acriflavine 'B D' is prescribed also in oral sepsis and in internal septic conditions

Practitioners of Physical Medicine Group of the Association

Notice is hereby given that a meeting of the Practitioners of Physical Medicine Group of the Association will be held at the B M A House Tavistock Square London W C 1 on Friday January 8th 1937 at 4 p m

Members of the Association who have specially studied the values of physical methods in the prevention and cure of disease and whose practice is predominantly devoted to the application of physical methods excluding radiology are *ipso facto* members of the Group and are invited to attend the meeting

Agenda

1 Appoint Chairman of Conference

2 Consider *Report of Group Committee including* a report of the effect on the Group of the formation of a Radiologists Group and a proposal to amalgamate the Spa Practitioners Group and the Physical Medicine Group

3 Consider Terminology used in connexion with the practice of physical medicine

4 Consider Charging of fees at clinics and hospitals

5 Appoint Group Committee for 1936-7

6 Consider Any other relevant business

C HILL
Deputy Medical Secretary

Radiologists Group

A meeting of the recently formed Radiologists Group of the Association will be held at B M A House Tavistock Square W C 1 on Friday January 15th 1937 at 5 p m The Group consists of all those members of the Association who are engaged predominantly in the practice of radiology The agenda will consist of (*a*) the election of a Chairman (*b*) the election of a Group Committee of six and (*c*) a general discussion on the work of the Group

C HILL
Deputy Medical Secretary

SURREY BRANCH RICHMOND DIVISION—Friday January 8th B.M.A. Lecture by Dr. Eric Pritchard Infant Feeding and Welfare'

Meetings of Branches and Divisions

ESSEX BRANCH NORTH-EAST ESSEX DIVISION

At a meeting of the North-East Essex Division held at Colchester on October 14th 1936 the following officers were elected

Chairman Dr. R. C. Turnbull *Vice-Chairman* Dr. J. R. Hickinbotham *Secretary and Treasurer* Dr. S. A. Propert

On the motion of Dr. A. NOLAN FELL seconded by Dr. P. W. ROWLAND the meeting agreed to the proposal that members of the Colchester Medical Society and the North-East Essex Division should be permitted to attend each other's meetings but may not vote or hold office unless otherwise qualified and that the Division pay a share the amount to be arranged of the expenses of the combined meetings. The agreement is subject to the confirmation of Headquarters.

GIBRALTAR BRANCH

The annual general meeting of the Gibraltar Branch was held on October 29th 1936 when the following officers were elected for 1936-7

President Colonel A. M. Fraser D.S.O. *Vice-President* Dr. A. A. Russo *Honorary Secretary and Treasurer* Dr. James A. Durante

The annual dinner of the Branch was held at the Assembly Rooms on November 19th when Colonel FRASER was in the chair. The function as usual proved a great success.

A meeting of the Branch was held on December 3rd when Colonel FRASER delivered his presidential address on The Genesis of the St. John Ambulance Association. Colonel Fraser traced the history of the Association from its early days in a small hostel in Jerusalem and described its eventful career militant and philanthropic through the ages up to its present constitution and activities. The address was greatly appreciated by the members and a hearty and unanimous vote of thanks was accorded Colonel Fraser.

GLASGOW AND WEST OF SCOTLAND BRANCH

Two meetings have been held by the Glasgow and West of Scotland Branch one on October 14th 1936 and the second on November 18th 1936 with Dr. J. G. MCCUTCHEON, the president in the chair.

At the first meeting a film lecture was given by Dr. E. ST. G. GILMOUR of the Evans Biological Institute his subject being the preparation and standardization of antitoxins and prophylactics, with special reference to diphtheria. In the subsequent discussion Dr. A. K. CHALMERS late medical officer of health for Glasgow recalled the great fall in case mortality which had been brought about by the introduction of antitoxin treatment and emphasized the importance of losing no time in submitting every possible case to it without waiting for a conclusive bacteriological diagnosis. A useful supplement to the film which had been shown would be one dealing with the Schick test for susceptibility.

Dr. THOMAS ANDERSON deputy superintendent of Ruchill Fever Hospital, spoke from the standpoint of the field worker and remarked that nowadays there was scarcely any risk of unpleasant reactions following the administration of antitoxin which should therefore be given to every suspicious case swabbing of the throat being regarded only as a supplementary. It should be remembered that the gravis type of diphtheria organism might grow poorly on Loeffler's medium and the test be inconclusive. This type had not yet been seen much in Glasgow but the number of intermediate types would seem to indicate that its advent might be expected. More attention should be paid to the clinical diagnosis since in these cases recovery depended on early and efficient treatment. As regards the use of prophylactics alum-precipitated toxoid had not justified the early expectations nor had the one-shot immunization procedure proved fully effective. Dr. Anderson relied on two injections of 0.1 and 0.3 c.cm. respectively with a week's interval between them. Since the adoption of this practice there had been no case of diphtheria among the nursing staff of Ruchill Fever Hospital in eighteen months. The intranasal instillation of drops of diluted formol toxoid (which could be performed at home by the child's mother) was giving excellent results in Denmark. In a recent visit to that country Dr. Anderson had seen figures indicating as much as 100 units of antitoxin per cubic centimetre of blood following such a course. Toxoid-antitoxin floccules in three injections at weekly intervals of 1 c.cm. gave excellent results without risking an unpleasant reaction.

Applied Immunology

On November 18th Dr. E. F. ROBERTS of the Lederle Laboratories, New York, delivered an address on recent advances in applied immunology with particular reference to serum therapy, this was followed by a film illustrating the treatment of pneumonia. He pointed out that the peptic digestion method of refinement had greatly facilitated the serum therapy of the exotoxic infections. Alum-precipitated toxoid was a practical and adequate method of immunization against diphtheria. The Neufeld rapid typing procedure had stimulated the specific treatment of pneumococcal pneumonia by facilitating its early initiation and consequently greater efficiency. In the case of measles control had been rendered more powerful by the discovery of the value of placental extract in this respect as well as the introduction of modifications permitting the establishment of active immunity without danger to the patient. The induction of a modified form of the disease by the use of serum was indicated for normal and healthy children who had been exposed to infection and the complications and sequels were few and usually trivial.

Dr. R. D. STUART bacteriologist to the Royal Infirmary Glasgow thought that the administration of antitoxin to every case of scarlet fever was not economically justifiable in this country since hospital treatment of these cases was a preventive of infection in contacts. He agreed with Dr. Roberts that in diphtheria the level of the Schick reaction was too low to ensure absolute immunity and added that one-shot A.P.T. immunization was only likely to be effective in selected areas in which there was already a widespread partial immunity. In the case of pneumonia he preferred the Neufeld typing method, but it was not easy technically, and therefore parallel mouse inoculation with slide inoculations should always be performed until familiarity with the Neufeld method had been attained.

Dr. LEON CHALMERS expressed the opinion that the cause of death in pneumonia was anoxaemia, bacteraemia or exhaustion. While not depreciating the value of serum therapy, he doubted whether the statistics cited by Dr. Roberts could be deemed fully satisfactory in indicating where the best results could be obtained until these further subdivisions were made. While the intravenous injection of glucose was a useful adjunct in the treatment of pneumonia myocardial failure was rare. The so-called cases of heart failure were really cases of exhaustion due to the long-continued pain and loss of sleep.

LACTAGOL (Edestine, Calcium, Phosphorus) helps to compensate for the constant drain by the foetus upon the reserves of the expectant mother
It is a valuable roborant during convalescence following parturition and exerts a definite galactagogue action on the mammary glands of the nursing mother
Specimens for clinical trial free on application Lactagol Ltd, Mitcham, Surrey

Expectant and Nursing Mothers thrive upon Lactagol

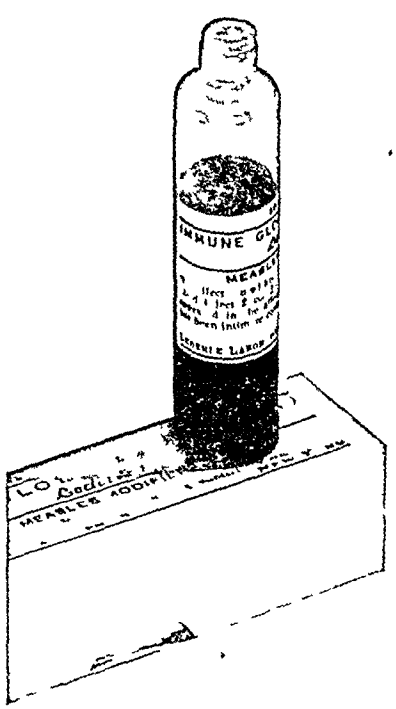
Measles Control with



IMMUNE GLOBULIN (HUMAN)

Lederle

BECAUSE of the frequency of complications, the mortality rate of measles is high—higher than that for whooping cough, diphtheria and scarlet fever

Complications can be avoided by the use of IMMUNE GLOBULIN (HUMAN) *Lederle*, particularly those of bronchopneumonia—responsible for about 50% of deaths in the infant age group (6 months to 3 years)

As a modification dose, one injection of 2 cc is administered to patients in the infant age group from 6 to 8 days after exposure (for children in the same family this is 2 to 4 days after the appearance of rash in the exposing child) This dosage confers an active and lasting immunity in the majority of cases For passive immunity of several weeks, a first dose of 2 cc of IMMUNE GLOBULIN (HUMAN) *Lederle* is administered as soon as contact has been recognized, a second dose of 2 cc four days later

IMMUNE GLOBULIN (HUMAN) *Lederle* is distributed in 2 cc vials and 10 cc vials

A purified fraction of liver extract possessing remarkable hæmopoietic properties

NEO-HEPATEX

(PARENTERAL)

For intramuscular or intravenous use

Neo-Hepatex (parenteral) is the result of an original process designed to conserve the maximum amount of the active hæmopoietic fraction of liver, and is prepared under the supervision of a staff of biologists with ten years' experience in research work on liver extracts

In addition, each batch is clinically tested in hospital This ensures the high and consistent clinical activity which has made Neo-Hepatex an accepted standard in parenteral liver therapy the world over A copy of the relative clinical test chart is enclosed in each box

Neo-Hepatex may be administered in any dosage demanded by the condition of the patient, its clinical potency enabling the clinician to give a more than adequate dosage in small volume

Neo-Hepatex is issued in Ampoules

Boxes of 6 × 1 cc - 5/- 6 × 2 cc - 7/6 3 × 4 cc - 6/6

The high potency of Neo-Hepatex renders it most economical in cost

NASOPHARYNGEAL SEPSIS IN 2,056 CASES OF MENTAL DISORDER

THE IMPORTANCE OF CLOSED SEPSIS

BY

T C GRAVES, M D, F R C S

Chief Medical Officer City of Birmingham Mental Hospitals

The observations on and treatment of 2 056 cases of mental disorder—mainly certified—by three ear nose and throat surgeons working separately during nine years from 1927 to 1935 inclusive in the Birmingham Mental Hospital are summarized in the following paragraphs

Selection of Patients

The cases thus treated have been selected as follows On admission all patients have had a routine investigation by the medical officer in charge of the case into the mental and physical states, including a preliminary examination for diseased conditions in the ear nose and throat Patients in whom a history or mental or physical symptoms suggested such a condition were further investigated by the visiting rhinologist employing special methods of examination when desirable On these findings, and after consultation between the visiting and resident medical staffs cases thought suitable on mental and physical grounds for further investigation and likely to tolerate the appropriate anaesthesia were selected

Appropriate treatment was then given, although this stage of active investigation and treatment was not generally carried out until the mouth was free from sepsis Tables showing the incidence of diseased conditions found and some of the treatment applied in the cases during the past nine years are presented below

Analysis

Of these 2 056 cases of nasopharyngeal sepsis in mental disorder 1,019 were men and 1 037 women In 180 cases 102 male and seventy eight female the conditions found clinically did not warrant anything more than a thorough antiseptic irrigation of the cavities explored In the remaining 1 876 cases 917 male and 959 female the following conditions were found and treated

DISEASE OF THE LYMPHOID TISSUE OF WALDEYER S RING

Adenoids were found in association with disease in neighbouring tissues in 129 instances fifty nine men and seventy women and were removed Disease of the tonsils was diagnosed in 1 356 instances out of the total of 2 056 cases—that is in 618 men and 718 women—and they were removed by blunt dissection in 1 186 cases 548 men and 638 women In the other 150, which comprised seventy males and eighty females tonsillectomy was not possible or expedient In 175 instances fifty nine males and 116 females the tonsils only were considered diseased while in 559 men and 602 women—a total of 1 161 cases—a nasal sinus investigation was done at the same time as the tonsillectomy

DISEASED CONDITIONS OF THE NASAL SINUSES

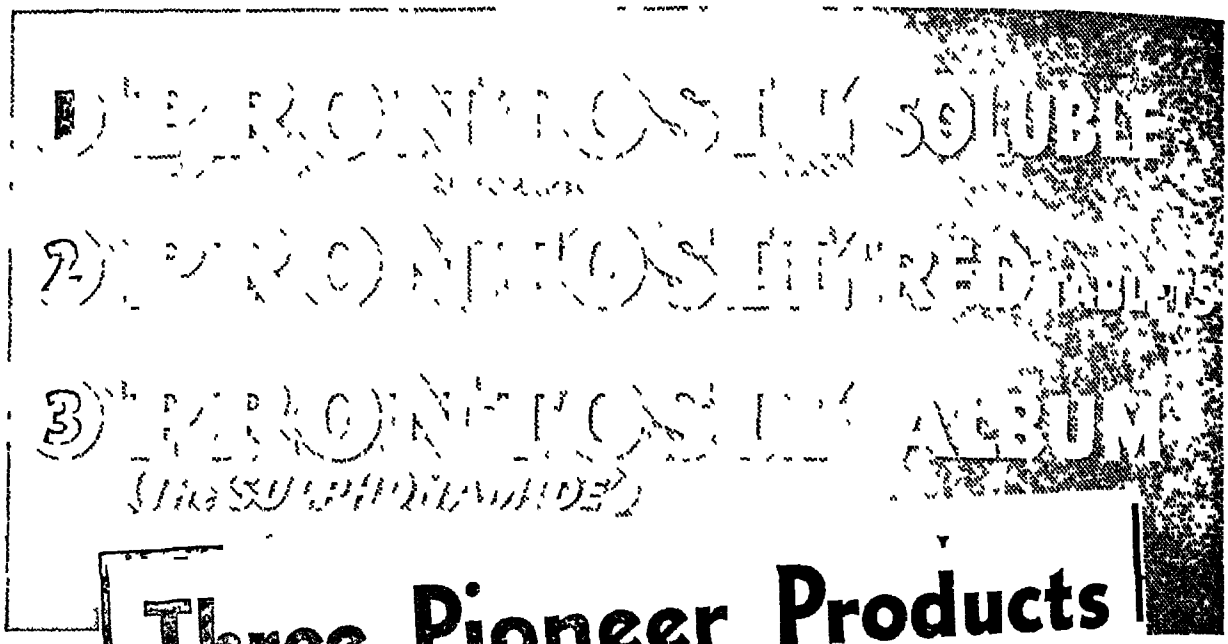
A general nasal sinus examination was carried out in 1 360 cases 734 males and 626 females and in 521 cases, 226 males and 295 females the investigation was not carried further than antral exploration In this way a total of 1 881 persons 960 males and 921 females were examined by the Watson Williams technique of suction exploration

Clinically diseased conditions of the nasal sinuses were found in 1 425 cases 743 males and 682 females The sinuses alone were thought affected in a total of 607 cases, 338 males and 269 females but in 818 cases 405 men and 413 women disease of the tonsils was diagnosed in association with the sinusitis

DISEASED SINUSES IN INDIVIDUAL CASES

The number of diseased sinuses found in individual cases is set out in the following table

Number of Sinuses Involved	Male	Female	To al
One sinus only	189	183	372
Two sinuses	205	192	397
Three sinuses	107	105	212
Four sinuses	129	104	233
Five sinuses	51	49	100
Six sinuses	62	49	111
Total	743	682	1 425



Anatomical Distribution of Sinus Disease—The distribution of the sinus disease whether or not associated with tonsillar disease in these 1 425 cases is shown in the following table

Affected Sinuses	Male	Female	Total
Antra alone or with other sinuses	616	53_	1 148
Ethmoids alone or with other sinuses	4 0	392	812
Sphenoids alone or with other sinuses	299	2 4	573

INCIDENCE OF SINUS DISEASE

The following figures give an approximate percentage incidence of the anatomical distribution of the sinusitis in those 1 425 cases in which the clinical findings were positive antra 80 per cent ethmoids 57 per cent sphenoids 40 per cent

Antra—Here the figures of cases investigated by general nasal sinus examination and antral exploration are combined —namely 1 881—and of these antral disease was present in 1 148 cases—that is 61 per cent

AFRICA HOUSE, KINGSWAY, LONDON, W.C.2

Ethmoids and Sphenoid Sinuses—To show the corresponding incidence of disease in these sinuses only the figures of the general nasal sinus examination can be taken—namely 1,360 cases. Ethmoidal disease was present in 812 cases—that is, 59·7 per cent., the percentage incidence of the sphenoid disease was 42·1.

These figures of the incidence of sinus disease in the cases examined by the Watson-Williams technique, based on clinical observation only, are of interest in view of the large number of cases, the great majority being direct admissions during a period of nine years, investigated by three rhinologists working quite independently of each other. They do not include those cases in which bacteriological examination of the wash-outs alone showed the presence of infection.

Closed Nasal Sepsis in Psychosis

In tuberculosis haemoptysis may first draw attention to the disease. Symptoms of general paralysis may be the first indication of syphilis. Mental depression following influenza may continue until an area of residual infection in the nasal sinuses is treated effectively, when the psychotic disturbance passes away. In some cases of nasal sinus disease mental symptoms may be among the first of the signs and symptoms directing the attention of the family or physician to the fact that the patient is ill. In some cases where nasal sinus disease is present an examination of the nasal passages may show only doubtful signs or none at all, the condition being one of closed sepsis. In such cases an inflamed sinus is unable to discharge its exudate owing to closure of its ostium, and as a result internal absorption and extension of inflammation takes place from the diseased membrane.

It is especially in dealing with cases of mental disorder arising from nasal sinus disease that these untoward conditions occur, for here may be shown the truth of the old clinical observation 'As the indications of toxaemia increase the discharge diminishes." Conversely there may be some truth in the assertions of those critics who aver that they have seen hundreds or even thousands of individuals with sufficient pus and sepsis in various parts of their organism to float the proverbial battleship, yet, while they may show symptoms of physical distress, not one of these folk was really insane. These are cases of open sepsis and little toxic absorption. If, however, the capacity to react in this way is reduced or drainage is prevented then complications arise, one of which is the acute mental disorder known as delirium, which sometimes precedes death. Should the patient survive then mental disorder and perhaps certifiable insanity may ensue, and continue, as the result of the persistence in an important site of a small area of "occult" sepsis, which acts as the primary portal of entrance of infection and is responsible for the obvious and dramatic collection of pus elsewhere.

The pathology of this condition is described by Pickworth in his book, *Chronic Nasal Sinusitis and its Relation to Mental Disorder*. An example of this pathology is as follows:

CASE 1.

A married woman aged 30 with congenital polycystic renal disease, nephrolithiasis and nasal sinusitis developed mental disorder was certified insane and admitted to a mental hospital where the nephrolithiasis was found. It was noted that the intensity of the mental symptoms was increased or diminished by conditions which respectively prevented or permitted the free egress of the discharges from the pyonephrolithiasis.

Following removal of the calculus by operation she became delirious and feverish until a subphrenic abscess was opened and drained, when her mental state became normal and she was discharged to her home. She continued well for about three months until, probably as a result of sea bathing she suffered a "chill," and again became depressed and was admitted to a mental hospital, where once again albumin and pus were found in the urine.

On investigation it was seen that a multisinusitis which previously had been discharging pus on both sides of the nose was now not reacting on one side and only partly so on the other side. After intranasal drainage of these affected cavities there was definitely less pus in the urine which later became free from pus and albumin. This was associated with further mental and general physical improvement. The patient said that she was now in a better physical state than she had ever been before in her life, and this was supported by the fact that her periods, previously irregular, had now become regular. Mentally she had recovered.

She has during the past seven years since discharge maintained that enhanced psycho-physical vitality in a self-supporting employment. In this case, therefore, the intensity of the psychosis and its type varied inversely with the degree of drainage.

Closed Sphenoidal Abscess in Mental Disorder

The association of a disordered mental state with sphenoidal sinus disease was first described by Jonathan Wright in 1902 when he published *A Case of Isolated Unilateral Latent Empyema of the Sphenoidal Sinus with Delirium and Mental Symptoms*. This work has become a classic in this branch of mental disorder. The author had the clinical acumen to conclude from symptoms only that a condition of disease existed in the posterior nasal sinuses and the courage to operate in order to relieve a fellow rhinologist, aged 57, from a condition of intolerable pain and pronounced mental symptoms, enabling him, as Wright has informed us later,

"to live for many years after the operation attending to a large practice and never failing to call me up on the telephone on his birthday and thank me that he was enjoying it. He was operated on for his sphenoidal trouble at a time when operative procedures on that cavity were uncommon, to say the least, and his delirium would have frustrated the present technique in many hands, and my crude method twenty-five years ago was entirely successful in its results."

Yet Wright operated—and it was an operation of no minor magnitude—without any classic signs of disease in the nasal sinuses or nose to support his diagnosis. He even says that "the presence of pus in the nose is not necessary to a diagnosis of sphenoidal disease." The patient had already seen a very distinguished confrere, who had assured him he had no nasal trouble, but advised him to go away for his health. He had been seen by other specialists who were unable to make a definite diagnosis. On Wright's own examination he found

"the nasal mucosa, except for some congestion was healthy and clean, and there was no especial obstruction to be seen either anteriorly or posteriorly. The middle turbinated bone, while apparently normal, left a very narrow slit in the nose through which inspection of the ethmoidal or sphenoidal region was very unsatisfactory. Posteriorly a good view of the region was obtained in the rhinoscopic mirror, but nothing especially significant could be noted. Transillumination of the frontal and maxillary sinus gave bright spots over the regions. I was, however, more convinced that the patient had pus under pressure in the left sphenoidal sinus and perhaps in the posterior ethmoidal cells. This I advanced to the patient as a tentative diagnosis." Later, just after the patient "had spat a foul smelling cheesy mass from his nasopharynx I immediately examined his nose and nasopharynx again but I could discover no sign of pus following the extrusion of the mass, nor indeed any other abnormality. From the fact that no pus had followed the semi-solid mass I was inclined to think the trouble in the sinus might be a malignant growth."

ANAHÆMIN B.D.H.

In Clinical Practice

Below are given three typical case-reports of patients treated with Anahæmin B D H by a well-known physician who states that the cases are all typical Addisonian anæmia, he is aware that the dosages are higher than those recommended, but even with these he is extremely pleased with the results which are better than those he has obtained with any other treatment

CASE 1	19 8 36	R B C 1,000,000 Hb 25% Injected Anahæmin 1 c c on 19th, 20th, 28th, 3rd, 7th, 10th and 28th
	28 9 36	R B C 4,500,000 Hb 70%
CASE 2	10 10 36	R B C 1,500,000 Hb 40% Injected Anahæmin 1 c c on 12th, 17th, 19th, 23rd, 25th, 27th, and 4th
	10 11 36	R B C 3,500,000 Hb 65%
CASE 3	29 10 36	R B C 1,500,000 Hb 30% Injected Anahæmin 1 c c on 30th, 31st, 3rd and 10th
	13 11 36	R B C 3,250,000 Hb 65%

An S 20

Nevertheless Wright did not deviate from his original diagnosis and 'as the patient's condition showed no improvement it was decided to make an effort to explore the sinus Now what symptoms did Wright describe on which to base his diagnosis of nasal sinus suppuration with occlusion of the ostium?

There was a history of influenza accompanied by severe coryza and left head pain, which latter continued to recur in attacks of increasing severity and duration there had been severe attacks of sneezing but no nasal discharge On examination

his speech was low and his manner dazed He said he was desperate The pain in his head was unendurable In speaking he would raise his left hand to the vertex of the head toward the occiput and bring it down to his left eye and below, which gesture often repeated localized the pain better than he could describe it

There was great hyperaesthesia of the scalp, the breath smelt foul, the temperature was subnormal the pulse slow, there was some doubtful proptosis of the left eye but the retinae, apart from slight congestion in the left eye, were normal as was the vision Blood and urine were normal Mentally in the early stages he had been somewhat forgetful, irritable, and emotional, but later he was unable to carry out his work properly, and later still he became delirious It is submitted that the due recognition of such signs and symptoms as indications of nasal sinus disease would lead to better agreement between workers on this subject

Closed Antral Disease and Mental Disorder

In the next case there were no signs in the nose suggestive of sinus disease, and the usual deductions from the findings on transillumination of the antra were reversed by the suction exploration technique of Watson Williams Therefore the indications for treatment based solely on the orthodox criteria of sinus disease would have been *nil* and it is obvious that the resulting inactivity would have been ineffectual in curing the disease or alleviating the symptom state which arose from it

CASE II

A housewife married and aged 46 was admitted to a mental hospital on January 7 1930 she was discharged on August 7 1930 An investigation into the family history failed to disclose any evidence of insane heredity in three generations The patient came of what appeared to be a very healthy and long lived family She was the mother of six children all alive and well and those over school age were all at work

History—The onset of the present illness was gradual beginning about three months before admission She complained of not being well, but repeated medical examination failed to detect any bodily disease and found incipient nervous breakdown She became more depressed and slept poorly Finally she wandered away from home and attempted to cut her throat on January 1 was then admitted to the mental hospital Her weight was 5 st 13 lb height 4 ft 11½ in Her general health was poor No abnormality was found in the chest or abdomen the blood pressure was 136/88 mm Hg The fauces were injected the tongue moist and clean she was edentulous Her headache was frontal and vertical The face was asymmetrical the left half flatter than the right There was left sided ptosis and the left angle of the mouth drooped Both pupils reacted to light and accommodation though at times the left pupil was one and a quarter times larger than the right No other neurological signs were detected except a coarse tremor of the hands Gynaecological examination and an investigation of the urine were satisfactory the blood Wassermann reaction was negative The Widal test was positive to 7 Oxford units to *B dysenteriae* Y no abnormal organisms were found in the faeces

Examination of the ear nose and throat gave the following results anterior nasal spaces clear posterior nasal spaces slight enlargement at the posterior end of the right middle turbinate and enlargement of the right lateral pharyngeal band tonsils normal ears drums normal nasal sinuses on transillumination frontal sinuses, fair, antra right dull and left clear

Mental State—Mentally she was depressed her emotional control was poor and orientation defective recent memory was poor She realized she was ill and told a long wandering semi coherent story of 'funny turns' and 'queer sensations but was unable to explain what she meant by these terms She was troubled by a constant buzzing noise in the right ear but also stated that she heard her children crying and her husband abusing her During January and February she had amenorrhoea, and was given aloes and iron The mental state continued as already described with variations in intensity probably dependent on menstrual irregularities At one time the devil did not bother her as much as formerly but a month after admission she stated that all her former ideas had come back again and she was agitated distressed, and depressed as before Ultra violet light and colon irrigations were being given This treatment continued until the middle of March without any amelioration of the mental state The lack of response was indicative of the presence of closed sepsis

Treatment—A bilateral antral investigation using the Watson Williams technique now showed right antrum clear left antrum pus The cavities were thoroughly irrigated with antiseptic solution but not drained This was followed by a pyrexial reaction reaching to 102° F for three days and by the return of menstruation during March Although in some degree better she was still unstable and had mental and physical exacerbations in relation to amenorrhoea which recurred during April and May Both antra therefore were drained intranasally at the end of May and the menses returned during the second week in June but on this occasion without pyrexia and without exacerbation of mental symptoms in fact there was physical and mental improvement

She was now able to describe the subjective aspect of the development and character of her illness There had been five sensory disturbances troubling her during the illness vertical headache, giddiness bilateral buzzing tinnitus aurium worse on the right cacosmia and cacogeusia All these had ceased and only a mild premenstrual frontal headache remained Life was now worth living Physically the facial colour mobility and tone had much improved and the left facial weakness had passed away The blood pressure was 164/100 mm Hg and her weight was 7 st 2 lb

Objectively she had now recovered She was discharged on August 7 1930 Seen later her pupils were found to be equal and reacting equally to light and accommodation During the six years since discharge she has kept well and stood the anxiety of a mental breakdown of her son visiting him regularly whilst he was in a mental hospital and reporting sensibly on his week end leaves of absence from hospital The son aged 20 made a substantial recovery from a state of adolescent psychosis of a year's duration before admission following removal of dental and tonsillar sepsis and of three impacted and unerupted wisdom teeth Since discharge he has kept well

Other Illustrative Cases

In the following extracts from three further cases of mental disorder and sinusitis it is sought to show that it is by no means uncommon for closed sinus sepsis to occur in cases of mental disorder in which the indications in the nose or on transillumination of the sinuses are atypical Other examples of atypical findings are furnished by cases recorded in the annual reports of the Board of Control (Parts II) from 1928 to 1935 The lack or even reversal of the classical signs of sinusitis on

Iron in Cocoa

The high mineral value of COCOA is being increasingly appreciated It is now known to be one of the most useful dietetic sources of iron — by far the richest among foodstuffs in common use

The table of comparisons set alongside will be of interest, therefore — and possibly of assistance — to general practitioners whose ordinary dietetic recommendations have so often to be directed towards preventing and combating specific mineral deficiencies It will be noted that whether 'total iron' or 'ionisable iron' is to be taken as the probable measure of *available iron* (the point still seems in doubt) COCOA exceeds all the previously accepted sources except one

FOOD	TOTAL IRON mg 100 g	IONISABLE IRON mg 100 g
Apples	0 23	0 19
Potatoes	0 62	0 58
White bread	1 07	0 93
Digestive biscuits	1 57	1 43
Raw eggs	2 50	2.50
Brazils	2 70	1 65
Wholemeal bread	3 43	2 85
Raw beef	3 54	0 39
Raisins	3 80	3 68
Almonds	4 54	4 50
Raw ox liver	6 70	5 22
COCOA	14 20	13 20
Raw pig's liver	20 00	16 00

See *Biochemical Journal* xxx 4 582 91

Cadburys

BOURNVILLE COCOA

RECOGNISED BY ALL FOOD AUTHORITIES AS COCOA AT ITS BEST

examination of the nasal spaces and transillumination in cases of mental disorder is apt to discourage beginners in these investigations, and it is well that they should realize the problems which confront them

On the other hand critics cannot in these cases bring the complaint against the Watson-Williams suction-exploration technique that it is not reliable because it can aspirate pus from the nasal passages through the ostia into the sinuses when the sinuses are free from exudate The careful surgeon should always take care to remove any such pus if present in the nasal passages with tampons of gauze before proceeding to insert the cannulae In these cases of closed sinusitis, however, where there is no pus visible in the nasal passages it can hardly be asserted that pus found on suction-exploration of the sinuses has come from those nasal passages

CASE III

In a case of acute puerperal insanity on rhinological examination crusting was found on the anterior end of the right middle turbinate On Watson Williams suction exploration the membrane of the right sphenoidal sinus was found thickened and there was muco-pus in the left antrum

CASE IV

This was a case of psychosis due to ill health gradually developing during several years after childbirth On rhinological examination we found ears drums retracted, nose, both inferior turbinates enlarged, throat, pus in both tonsils and a retained abscess in right tonsil On Watson-Williams suction-exploration muco-pus was found in both antra

CASE V

In this case routine rhinological examination was impossible owing to the suicidal condition of the patient rendering her absolutely non cooperative She was therefore examined under an anaesthetic, when sufficient indication was found to warrant a nasal sinus examination by the Watson-Williams suction exploration technique This showed the presence of pus in the right sphenoidal sinus

Closed Sinus Disease at Necropsy

In two cases of mental disorder closed sinus disease was only discovered at necropsy In the first of these cases while there was some crusting of the left anterior nasal space, which might have corresponded to the greenish-yellow pus found in the left antrum, there was no free pus visible on removal of the crusts On the right side the anterior nasal spaces were clear, but there was pus in the antrum at necropsy

CASE VI

The patient was a male aged 58 with a history of recurrent nasal sepsis and hallucinations and delusions' suggestive of some disturbance in the ear nose, or throat The blood Wassermann reaction was negative and there was no evidence of syphilis On ear nose and throat examination anterior rhinoscopy showed crusting of the anterior nasal space on the left side the right side was clear nothing was seen on posterior rhinoscopy on transillumination the antra were dim, the frontal sinuses fair, the tonsils were fibrotic adherent, and septic the ears were normal, in the mouth there was gross pyorrhoea with many carious teeth and roots, especially in left maxilla and right mandible Sudden death occurred three weeks after admission and before any operative intervention had taken place At necropsy the frontal and sphenoidal sinuses were clear but the left antrum contained much greenish yellow pus and in the right antrum there was pus on the medial wall the tonsils contained pus Well marked atheroma was present in the aorta on the semilunar cusps and extending down on to the mitral valve and around the coronary arteries A patch of atheroma was situated within and completely occluding the left coronary artery for half an inch The right artery was fairly patent

In the second case, as a result of clear nasal spaces and satisfactory transillumination findings, the sinuses were not investigated, although the septic tonsils were removed At necropsy some years afterwards a multisinusitis was found, which was probably present on admission and the cause of the old herpes ophthalmicus

CASE VII

A single female, aged 58 on admission to the mental hospital on April 27, 1931 A sister was in a mental hospital and an aunt had died there The present illness was described by another and very capable sister as being gradual in onset, beginning with depression, then delusions of persecution and finally auditory hallucinations appeared during the six weeks before admission The patient became increasingly secretive, went for long walks to get away from the "voices," and insisted there was "something working inside her"

On admission she had the scarring of an old herpes ophthalmicus on the right temple The cardiovascular system appeared normal, the blood pressure was 134/86 mm Hg The thyroid was uniformly enlarged The pulmonary and abdominal viscera seemed normal The right pupil was slightly larger than the left, both were slightly irregular but reacted to light and accommodation The urine was normal, the blood Wassermann was negative She complained of frontal headaches and a bitter taste in the mouth in the morning although she was edentulous She was self centred, hallucinated, and deluded She said that she had a jumping sensation inside her and that people could hear this and consequently men shouted after her

There was liquid pus in both tonsils The ears were normal The post-nasal spaces were not seen, the anterior nasal spaces were clear On transillumination the antra and frontal sinuses were fair There appeared to be no indication on this examination for any active treatment beyond the removal of septic tonsils, and this was carried out

Neither then nor subsequently was any discharge from the nasal passages or other objective evidence seen which might have suggested the presence of sinus disease, and the patient was unable to assist in any way After the operation a course of non specific therapy was given, and in the following years there was some evidences of physical and mental amelioration The sensory disturbances persisted, but the confusion diminished so that she was able to recognize that the 'voices" she formerly complained of were really noises in her own head There was now no active complaint of these, nor of a variable cacosmia and headache, though they continued to occur The goitre, formerly quite prominent, disappeared She was able to go out on week end leave, and even for a month on trial during the winter of 1934-5 In 1935 she became more debilitated, but during this time there was never any evidence of nasal discharge She died suddenly in June, 1936, aged 63

At necropsy both sphenoids and both ethmoids contained pus, and the right antrum contained yellowish pus while the left antrum contained clear mucus Both frontal sinuses were moist The stomach walls were much atrophied The left coronary artery was atheromatous for the length of an inch about half an inch from its mouth

I wish to acknowledge my indebtedness to my colleagues of the visiting, resident and research staffs of the Birmingham mental hospital for their observations on and treatment of the cases on which this communication is based

According to investigations made by Professor G Modena, the number of insane under treatment in Italy in 1935 was 110,793, of whom 60,988 were males and 49,985 females On January 1, 1935, the insane numbered 83,541, and on January 1, 1936, 85 403

HERTFORDSHIRE BRANCH EAST HERTFORDSHIRE DIVISION

At a meeting of the East Hertford hire Division held at Ware on December 2nd 1936 with Mr J C NEWMAN in the chair the secretary was instructed to convey to Mrs Guith Fager the sympathy of the Division in the loss of her husband

A circular letter from headquarters concerning the provision of public mortuaries was read and discussed as was also a letter from the county medical officer concerning unregistered nursing homes

Mr C LANE ROBERTS then delivered an instructive address on Sterility This was followed by a discussion to which most of those present contributed

NORTHERN IRELAND BRANCH

A meeting of the Northern Ireland Branch was held at Belfast on December 3rd 1936 when the president Dr WM LYLE was in the chair After formal business had been conducted the PRESIDENT introduced his successor Mr H L HALL GREER who thanked the members for the honour they had done him in electing him president He proposed that the best thanks of the members be conveyed to Dr Lyle for his conduct in the chair during the year and for his hospitality to the members This was heartily agreed to

Mr GREER then proceeded to deliver an address entitled 'Concerning a Maternity Service' Mr Greer began by quoting from the occasional letter recently circulated by the Medical Secretary of the British Medical Association and he then analysed Departmental Committee reports the B M A scheme and the new Scottish Bill relating to the subject of a maternity service In this manner he presented to the members an excellent summary of the views held and shortly projected by the various bodies concerned Professor C G LOWRY expressed the general appreciation of the value of Mr Greer's contribution and discussed various items concerned in an ideal maternity service After other members had taken part Professor R J JOHNSTON pointed out the difficulty of reconciling medical ideals with administrative problems and he suggested that the Branch should co operate with a committee which was to be instituted shortly to report to the Government of Northern Ireland

SHROPSHIRE AND MID WALES BRANCH

A clinical meeting of the Shropshire and Mid Wales Branch was held at the Royal Salop Infirmary on December 1st 1936 when Dr R H URWICK was in the chair

The CHAIRMAN referred to the loss sustained by the area by the death of Dr Ernest Alfred Elkington one of the most respected medical practitioners in the county and a member of the British Medical Association since 1874

Dr F BULMER (Birmingham) gave an interesting address on Peptic Ulcer He dealt particularly with the aetiology and the treatment of the condition Great interest was evinced by the members present and a discussion followed in which many took part On the motion of the CHAIRMAN a hearty vote of thanks was accorded Dr Bulmer for his address

STIRLING BRANCH

A meeting of the Stirling Branch was held at Stirling on December 2nd 1936 when Dr R W CRAIG (Scottish Medical Secretary) gave an address on the Report of the Committee on Scottish Health Services and an explanation of the Maternity Services (Scotland) Bill Dr Craig gave an interesting outline of the genesis composition and report of the Committee with special reference to the recommendations likely to affect general practitioners His address was followed by questions and a discussion

UNITED PROVINCES BRANCH

A clinical meeting of the United Provinces Branch was held at Lucknow on October 30th 1936 when Captain K S NIGAM was in the chair The attendance included a large number of final year students and medical officers of the King George's College and Hospital who were present by special invitation

The CHAIRMAN showed (1) A case of accessory lactating breast in a girl of 14 with an infant 1 month old (2) A case of pedunculated polypus of the nasopharynx (3) A case of malignant pustule recovered under treatment (4) A case of haematuria which on investigation showed the presence of double ureter the haematuria was probably due to tuberculous disease of the kidneys the patient had some tuberculous glands in the axilla as well (5) A case of accidental hanging resulting in fracture of the hyoid bone

Captain R D ALEXANDER showed a case of peripheral neuritis with oedema of the limbs and paralysis of the soft palate Throat swabs were negative for diphtheria The cause of the condition remained obscure He also showed a case of tumour in the epigastrium in a young man

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses dermatology at St John's Hospital January 4th to 21st cardiology at National Heart Hospital January 11th to 22nd advanced urology at St Peter's Hospital January 18th to [illegible] a general practitioners' course in the diseases at Bromley Hospital January 25th to 30th surgical tutorial classes especially intended for candidates for the Final F R C S examination at National Temperance Hospital January 12th to [illegible] 4th at 8.30 p.m. The programme for the first week follows: January 12th Mr V J Cokkinis Breast Jan 14th Mr V M A Moore Injuries to Bones

As was briefly announced before the beginning of the autumn session the entire medical staff of the [illegible] Hospital are giving psychiatric demonstrations at St George's Hospital to alternate with the neurological demonstrations given by Dr Anthony Feiling at 5 p.m. on Fridays The following have been arranged for next [illegible] January 14th Dr Curran January 28th Dr A Bretherton February 11th Dr W H Hadfield February 25th Dr Guttmann March 11th Professor Symonds Dr Aubrey J Lewis Dr W H Hadfield [illegible] problems of childhood Dr Eustace Hunt Dr Fearnley [illegible] stations are not confined to the staff of the hospital

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE

Section of Orthopaedics—Tues 5.30 p.m. Cases and Specimens

Section of Surgery—Wed 8.30 p.m. Short Papers Dr [illegible] Stewart Wallace Post Operative Care of the Stump V H Riddell Peripheral Embolism Mr [illegible] Terminal Ileitis A discussion will follow

Section of Ophthalmology—Fri 5 p.m. Clinical Cases and Papers

---

WEST KENT MEDICO CHIRURGICAL SOCIETY Meeting at Greenwich S.E.—*Fri* 8.30 p.m. Clinical Evening

WEST LONDON MEDICO CHIRURGICAL SOCIETY Annual Dinner at Kensington Road W. *Fri* Discussion Is Deafness Neglected Speaker Mr Eric Peterkin Guests Chief Constable of Queensland K.C. and other Prominent Australians

WEEKLY POST-GRADUATE DIARY

BRITISH POST GRADUATE MEDICAL FEDERATION Daily 10 a.m. to 4 p.m. Medical Clinics Operation Obstetrical and Gynaecological Clinics Wed 1.30 p.m. Clinical and Pathological Conference (Obstetrical and Gynaecological) 5.0 p.m. Dr Dunlop Wednesday Demonstration 8.0 p.m. Mr Bright Banister Thurs 2 p.m. Operative Obstetrics 4 p.m. Mr W B Gabb Surgical Diseases of Rectum 5 p.m. Department of Gynaecology Pathological Demonstration

VACANCIES

ARGYLL COUNTY COUNCIL—M O for Morvern Salary £147 p a
BARNSLEY COUNTY BOROUGH—M O H and School M O Salary £900 £1 000 p a
BIRMINGHAM CITY MENTAL HOSPITAL—J A M O (male) Salary £350 £450 p a
BLACKHILL RICHARD MURRAY HOSPITAL—H S (male) Salary £200 p a
BOLINGBROKE HOSPITAL Wandsworth Common S W—H P (male, unmarried) Salary £120 p a
BRIGHTON LADY CHICHESTER HOSPITAL, HOVE FOR FUNCTIONAL NERVOUS DISEASES—Senior H P (female) Salary £100 p a
BRISTOL COSSHAM MEMORIAL HOSPITAL, Kingswood—J R M O (male) Salary £100 p a
BRISTOL ROYAL INFIRMARY—(1) Senior Casualty H S Salary £150 p a (2) Senior Obstetric H S Salary £100 p a (3) Three H P (4) Four H S (5) Assistant H S (6) H S to the Casualty Department (7) H S to the Ear, Nose, and Throat Department (8) Junior Obstetric H S Salaries £80 p a each
BURY COUNTY BOROUGH—Deputy M O H Salary £650 £25 £850 p a
BURY INFIRMARY—(1) R S O (male) (2) H S Salaries £300 p a and £175 p a respectively
CAMBRIDGE ADDENBROOKE'S HOSPITAL—Resident Anaesthetist and Emergency Officer (male, unmarried) Salary £130 p a
CANTERBURY KENT AND CANTERBURY HOSPITAL—Hon Anaesthetist to the Ear, Nose and Throat Department
CARDIFF ROYAL INFIRMARY AND THE WELSH NATIONAL SCHOOL OF MEDICINE—Part time Hon Dermatologist and M O in Charge of Male Venereal Diseases Centre
CHILDREN'S HOSPITAL Hampstead, N W—R M O Salary £150 p a
DERBY BOROUGH MENTAL HOSPITAL Rowditch—Second A M O (unmarried) Salary £350 £25 £450 p a
DONCASTER EDUCATION COMMITTEE—Part time Consultant for Diseases of the Ear, Nose, and Throat Remuneration £2 12s 6d per session
DONCASTER ROYAL INFIRMARY AND DISPENSARY—(1) R S O (2) Casualty H S (3) Resident Anaesthetist Males Salaries £250 p a £175 p a and £175 p a respectively
DORSET COUNTY—Senior School Dentist Salary £600 £25 £750 p a
DUNDEE ROYAL INFIRMARY—Hon Assistant Visiting S to the Gynaecological and Obstetrical Department
DUNEDIN NEW ZEALAND OTAGO HOSPITAL BOARD—Radiotherapist Salary £1 000 p a
EAST HAM MEMORIAL HOSPITAL Shrewsbury Road E—R M O (male) Salary £200 p a
HASTINGS ROYAL EAST SUSSEX HOSPITAL—J H S (female) Salary £150 p a
HAVERFORDWEST PEMBROKE COUNTY WAR MEMORIAL HOSPITAL—R M O (unmarried) Salary £150 p a
HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST Brompton S W—Three H P s Honoraria £50 p a each
HULL ROYAL INFIRMARY—Second C O (male) Salary £150 p a
INDIA GOVERNMENT OF—(1) Vacancy and (2) Vacancy for Indian Medical Service Officer in the Medical Research Department Salaries (1) Rs 625 Rs 1 350 per calendar month and (2) Rs 250 per mensem plus basic pay of rank and overseas pay
LABORATORIES OF PATHOLOGY AND PUBLIC HEALTH Harley Street W—Junior Assistant Pathologist (male) Salary £500 £25 £650 p a
LEEDS PUBLIC DISPENSARY AND HOSPITAL—Research Worker in Arthritis (male) Salary £300 p a
LEEDS UNIVERSITY SCHOOL OF MEDICINE—Readerships in (1) Medicine and (2) Surgery Salaries £600 p a each
LEICESTER ROYAL INFIRMARY—(1) Hon Dental S (2) Two Hon Assistant Dental S s
LIVERPOOL ROYAL LIVERPOOL CHILDREN'S HOSPITAL—(1) R M O and (2) R S O at the Heswall Branch Salaries £120 p a each (3) Two R H P and (4) Two R H S at the City Branch Salaries £100 p a each
LIVERPOOL STANLEY HOSPITAL—(1) H P (male) (2) Two H S (males) (3) Gynaecological H S (female) Salaries £80 p a each
LONDON COUNTY COUNCIL—(1) Resident Medical Superintendent for Queen Mary's Hospital for Children Carshalton Salary £1 400 £50 £1 650 p a (2) A M O (Grade I) and (2) A M O (non resident Grade II) for White Oak Hospital Swanley Females Salaries £350 £25 £425 p a and £250 p a respectively
LONDON HOSPITAL E—(1) Hon Assistant S in the Department of Neuro surgery (2) Surgical First Assistant and Registrar Salary £300 p a
LUTON BURY HOSPITAL—H S (male) Salary £150 p a
MANCHESTER CITY—(1) R A M O (male) for Monsall Hospital for Infectious Diseases (2) R A M O for Withington Hospital Salaries £350 £25 £450 p a and £200 p a respectively (3) Resident Assistant Obstetrical Officer for Crumpsall Hospital Salary £250 p a
MANCHESTER ROYAL INFIRMARY—(1) Four H S (2) Four H P (3) H S for Aural Gynaecological and Ophthalmic Departments (4) H S for Neuro surgical Department (5) H S for Orthopaedic Department Salaries £50 p a each
MANSFIELD AND DISTRICT GENERAL HOSPITAL—H S (male) Salary £150 p a
MARKET DRAYTON CHESHIRE JOINT SANATORIUM—R M O (male) Salary £250 p a
METROPOLITAN HOSPITAL Kingsland Road, E—C O and Resident Anaesthetist (male) Salary £100 p a
MIDDLESEX COUNTY COUNCIL—(1) Non resident P and (2) Radiologist for the County Sanatorium Harefield Salaries £650 £1,000 p a and £3 3s per session respectively (3) District M O and Public Vaccinator Harrow Salary £100 p a
MIDDLESEX HOSPITAL AND MEDICAL SCHOOL, W—Surgical Registrar Salary £300 p a
NEW ZEALAND PALMERSTON NORTH HOSPITAL BOARD—Pathologist (non resident) Salary £900 £50 £1,000 p a
NORWICH NORFOLK AND NORWICH HOSPITAL—(1) C O (2) H S to Special Departments Males, unmarried Salaries £120 p a each
NUNEATON GENERAL HOSPITAL—H S Salary £150 p a
PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY—Obstetrical M O Salary £1,000 p a
PRESTON FRIENDLY SOCIETIES MEDICAL ASSOCIATION—Whole time M O Salary £450 p a
QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E—Clinical Assistant to Medical Out patients Honorarium 5s per attendance
ROYAL CANCER HOSPITAL (FREE), Fulham Road, S W—R M O Salary £200 p a
ROYAL NATIONAL ORTHOPAEDIC HOSPITAL Great Portland Street W—Two H S (males unmarried) for the Brockley Hill Branch Salaries £150 p a each
SLAMEN'S HOSPITAL SOCIETY, Greenwich S E—Resident Medical Superintendent (unmarried) at the Hospital for Tropical Diseases, Gordon Street, W C Salary £400 p a
SHEFFIELD ROYAL INFIRMARY—Clinical Assistant to the Surgical Department Salary £300 p a
SOUTHAMPTON COUNTY BOROUGH—Part time Ear, Nose and Throat S (male) Salary £300 p a
STAFFORDSHIRE COUNTY COUNCIL—Assistant County M O H (male) Salary £500 £25 £700 p a
STOKE ON TRENT BURSLEM HAYWOOD AND TUNSTALL WAR MEMORIAL HOSPITAL—R H S (male) Salary £175 p a
STOKE ON TRENT LONGTON HOSPITAL—H S Salary £160 p a
WESTMINSTER HOSPITAL, Broad Sanctuary, S W—Assistant S (male)
WORCESTER COUNTY AND CITY MENTAL HOSPITAL Powick—A M O (male, unmarried) Salary £350 £25 £450 p a

CERTIFYING FACTORY SURGEONS—The following vacant appointments are announced (1) St Ives (Cornwall) (2) Dunbar (East Lothian) (3) Kettering (Northamptonshire) Applications to the Chief Inspector of Factories, Home Office, Whitehall S W 1, for (1) and (2) by January 5th, and for (3) by January 12th

Notifications of offices vacant in universities, medical colleges and of vacant resident and other appointments at hospitals will be found at pages 53 54 55 56 57 and 60 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 58 and 59

APPOINTMENTS

BOYD D H S, M B B Ch B A O Certifying Factory Surgeon for the Hungerford District (Berkshire)

DAVIES D L, M D F R C S, Medical Referee (for ophthalmic cases) under the Workmen's Compensation Act, 1925 for all County Court Districts at present comprised in Circuits Nos 24 and 30

MARRIOTT H L, M D M R C P Assistant Physician, Middlesex Hospital

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTHS

EDDIE—*On December 23rd at Westcott House, Hull to Marjorie* wife of Dr T Stirling Eddie (formerly of Melbourne), a daughter

HILL—On December 27th 1936, to Marion wife of Charles Hill M D a daughter

DEATH

WILKINSON—On December 17th at Sunny Bank (late Ashlea) Droitwich John Wilkinson M D

Printed and published by the British Medical Association at their Office Tavistock Square in the Parish of St Pancras in the County of London

ZINC PROTAMINE INSULIN

A CLINICAL TRIAL OF THE NEW PREPARATION

BY

R D LAWRENCE, M D, F R C P

AND

NORA ARCHER, M B Oxon *

(*From the Diabetic Clinic King's College Hospital*)

In 1936 Hagedorn and his Danish colleagues introduced to the world a new insulin compound, protamine insulin They had already employed it therapeutically in Denmark for some two years, and it has been on the market in this country for six months under the name Leo 'insulin retard' The uses and advantages of this protamine insulin have been described in many articles published in English and American medical journals (Hagedorn, 1936, Joslin *et al*, 1936, Krarup, 1935, Lawrence and Archer, 1936, Rabinowitch *et al*, 1936a Root *et al* 1936, Wilder, 1936)

Protamine is a simple protein obtained from the *sperm of fishes* At *pH* 7 2 *it forms with insulin a precipitated* compound protamine insulin, which is relatively *insoluble* in the subcutaneous tissues and is therefore more slowly absorbed than is the *soluble* insulin hydrochloride in general use The latter is so rapidly absorbed that its action is finished quickly, making two or three injections a day necessary for good control of severe diabetes As many as four and five injections a day have been administered by some workers Protamine insulin certainly acts for twelve hours, so that it has been possible to ensure a normal fasting blood sugar level in the morning by giving an adequate dose of this compound in the evening Hagedorn recommended that it should be used in this way, with soluble insulin in the morning to act quickly enough to control the sugar resulting from digestion of the day's carbohydrate food We felt, with many others, that an attempt should be made for the patient's sake to control diabetes with a single daily dose of protamine insulin The results were good with mild cases, but even with very large doses—60 to 100 units—control was seldom possible with severe cases Fortunately this possibility has been more nearly realized by the discovery of a longer-acting and more stable compound, zinc protamine insulin

This paper describes the known actions and qualities of the new preparation and the clinical results we have obtained in forty two patients who could not be controlled by diet alone, and required insulin The number of cases is small but *the majority have been carefully observed* under hospital conditions, and the results have been sufficiently consistent for us to form an opinion on the use, advantages, and disadvantages of zinc protamine insulin We have also had the privilege of seeing it employed in several Canadian and American clinics, where experimental work was started with it in June, 1936

Nomenclature

We have felt, since working with more than one type of insulin, and more especially since trying to write about them, that some accepted code of nomenclature is essential to avoid confusion

Until a year ago 'insulin' was insulin, and meant only one thing, at least clinically Since then protamine insulin has come from Denmark and zinc protamine insulin from Toronto and it seems likely that improved modifications of these may appear at any moment to add to the confusion of medical nomenclature and thought The fundamental difference between the old,' regular or ordinary' insulin (but surely insulin will always remain extraordinary, at least to the diabetic) and the new long-action insulins is their solubility at the *p*H at which they are injected The old insulin is injected in *solution*, the new insulins are injected precipitated *in a suspension* form We propose to use these terms to distinguish between them Below are some of the synonyms that are already current

I Insulin hydrochloride in solution in weak acid *pH* 3–4

Old insulin	Quick acting insulin
Ordinary insulin	Soluble insulin
Regular insulin	

II Precipitated compounds in suspension at neutral reaction *pH* 7 2

Suspension Insulin

Protamine Insulin	*Zinc Protamine Insulin*
Leo insulin retard (commercial name)	Protamine zinc insulin
Protamine insulinate	Canadian protamine insulin
Danish protamine insulin	Zinc protamine insulin suspension
	Protamine insulin (with zinc) suspension (Form adjusted by the Ministry of Health and recently adopted by insulin manufacturers)

When we remember that not only the medical profession but also the diabetic public buy and use these products the necessity for a clear distinction between them is obvious particularly in the naming and labelling of commercial preparations In the past the preparations of soluble insulin sold by different manufacturers have been almost indistinguishable in chemical nature and certainty in clinical action We hope that steps will be taken to make the new preparations such as zinc protamine insulin, as uniform as possible in zinc and protamine content and in the type of fish protamine employed

Zinc Protamine Insulin

The discoverer of this compound is D A Scott of Toronto, who had already worked on zinc insulin compounds for several years and had shown that crystalline insulin was a true chemical compound of zinc and insulin zinc insulinate (Scott and Fisher, *1935*) When he turned his attention to protamine insulin compounds he found that when entirely freed from traces of zinc and allied metals they were no more prolonged in action than the soluble insulin hydrochloride (Fisher and Scott, *1935*) The addition of traces of zinc and the adjustment of the *p*H to 7 2 produced a zinc protamine insulin compound in suspension which was more stable and more prolonged in its action than any previously discovered This has been proved experimentally (Fisher and Scott, 1935 Rabinowitch *et al* 1936b) both in men and animals and we find the length of action roughly proportional to the size of dose The exact chemical nature of the precipitated compound—whether a true salt or merely an indeterminate grouping—is not known Fortunately it is sufficiently stable to be issued in suspension in one bottle ready for injection This is an important advance on previous protamine compounds which had to be issued in two bottles—the buffer separate from the protamine insulin —and mixed by the patient before use The new compound is a stable fine suspension which sediments on standing, the bottle therefore requires shaking before injection to ensure a uniform suspension So far only one strength, 40 units per c cm, has been prepared but we think 80 units per

* Research Scholar, British Medical Association

mended the adoption of wholesale immunization with toxoid in the place of passive immunization with antitoxin, which latter should be reserved for any of the wounded who might not have been actively immunized, and even in that case only as a preliminary stage in active immunization

Ramon and Zoeller (1927) immunized several hundred persons by three injections of toxoid given in the same way as diphtheria toxoid The antitoxic content of their serum subsequently averaged from 0 3 to 1 unit per c cm After four years the titre had dropped considerably—to from 1/500 to 1/6 unit per c cm—but the injection of another dose of toxoid raised the antitoxic content of their blood to 3 units per c cm After the injection of 1 700 units of antitoxic serum the antitoxic titre of the blood does not reach more than 0 17 unit per c cm, and that for a few days only

P A T Sneath and E J Kerslake (1935) in Toronto estimated the antitoxic content of the blood in persons who had been immunized by the subcutaneous injection of three doses of tetanus toxoid Thirteen of them were examined two years after the immunization The titre of antitoxin remained at much the same level as it had been twelve months previously, in three of these there was 0 1 unit per c cm Another injection of toxoid was then given, and within a week in eleven out of the twelve the titre had risen to amounts between 1 and 10 units per c cm—from ten to five hundred times the former level One person responded poorly to immunization and in this case the titre did not rise above 0 025 unit Horses differ greatly in their response to immunization and it is not surprising that human beings differ in the same way The efficiency of the antibody producing activity of the reticulo endothelial system, and consequently the response to immunization as indicated by the antitoxic content of the serum varies greatly in different individuals In a few cases it has been found difficult to immunize sufficiently with diphtheria toxoid to produce a Schick negative reaction and Schick himself said he believes that there are some individuals who are totally incapable of developing antibodies against diphtheria Fortunately such instances must be very rare

Tetanus Alum toxoid

Glenny (1930) investigated the immunizing effect of tetanus alum toxoid on guinea pigs and horses using the precipitate formed after the addition of alum to tetanus toxoid He found that in the hyperimmunization of horses the addition of alum to tetanus toxoid doubled the value of the antitoxin produced and if horses were *rested for a month or more after a primary stimulus* before immunization was continued much stronger antitoxin was produced' This principle is adopted by Dr G F Petrie in the immunization of horses at Elstree An injection of alum toxoid is given on admission to the stables a second injection two or three months later, and then the injections are repeated every six months

D H Bergey (1934) also found that alum toxoid gave better results than untreated toxoid When 1 c cm was injected into a guinea pig the animal's serum contained 1 unit of antitoxin per c cm after ninety days when a second injection was given fifteen days later the content of the serum rose to 9 units per c cm Bergey used the same preparation of alum toxoid to immunize thirty five adult persons whose serum before immunization contained on an average 0 0001 unit of antitoxin per c cm Ninety days after the first inoculation the titre had risen to between 0 001 and 0 04 unit per c cm but a second injection 125 days later raised the antitoxin content to from 0 1 to 9 units per c cm—an increase of from one thousand to nine thousand times the original amount

Alum toxoid was prepared by adding alum (1 per cent or rather less) to the toxoid solution The resulting precipitate before being used for inoculation was thoroughly washed to remove any traces of alum or protein from the culture medium in order to avoid skin reactions None of the inoculated persons complained of local or general reactions

Conclusion

There seems to be no doubt that by the injection of toxoid or of alum toxoid, which seems to give even better results it is possible to confer complete and permanent immunity on the vast majority of those inoculated The immunity thus produced depends not only upon the presence of antitoxin in their blood but to a still greater extent upon the 'sensitization of the reticulo endothelial cells to tetanus toxin, and results in a much greater and more active response to the antigenic stimulus so that infection by tetanus bacilli at any later date will be countered by a rapid and increased output of antitoxin sufficient to afford complete protection

Such protection might be afforded to the British Army by the injection of two doses of alum toxoid at an interval of three months with the additional protection of a third inoculation before being called upon for foreign service or in the event of war This last inoculation might be combined with antityphoid immunization since it was found by Ramon and Zoeller (1927) that the efficacy of tetanus toxoid in immunization was actually increased if a bacterial vaccine such as T A B was injected at the same time

The papers referred to in this note are a few only from many that have been written on this subject in recent years

A Weissmann (*Wien klin Wschr*, December 18 1936 p 1556) draws attention to the value of hyperthermia in the treatment of myalgia neuralgia neuritis chronic arthritis neurosyphilis, etc This is supposed to be due to increase of resistance on the part of the organism which results in hastening the process of repair The author has produced hyperthermia therapeutically for the past six years by using a modification of Walinski's pack The patient is given a bath at 37 C wrapped in a flannel and six woollen blankets and left for six to eight hours Physical and chemical treatment—namely injection of proteins—combined allow of smaller quantities of the latter to be used Fever is induced every second day and in most cases a course of twelve packs suffices The injection of *10 c cm of 20* per cent salt solution for the prevention of sweating according to Walinski's original method is stated by Weissmann to be unnecessary Hyperthermia should never be produced in tuberculous cases or in those with cardiovascular disease The author also recommends a pack used by Abrahamowicz which is milder than Walinski's and more pleasant for the patient Different varieties of herbs exposed to x rays and ultra violet light are put into thirty little sacks and heated to 45 C fifteen sacks are placed below and fifteen on top of the patient who is wrapped in a rubber and woollen blanket In three quarters of an hour the temperature may reach 39 C The pharmacological action of the herbs and the setting free of vitamins through radio activity as declared by Abrahamowicz are denied by Weissmann

c cm will also be necessary for the convenience of patients

The amount of zinc added is very small—1 mg in 500 units of insulin—so that even the severest diabetic would not receive more than 1 gramme of zinc in ten years Zinc in this substance is not toxic, and has not caused any general ill effects

Action of Zinc Protamine Insulin

The difference in action between soluble insulin and zinc protamine insulin seems to be entirely due to the difference in their rates of absorption from the subcutaneous tissues Soluble insulin begins to lower the blood sugar from fifteen to thirty minutes after the time of injection Zinc protamine insulin shows little if any effect on the blood sugar in the first three to six hours after injection The action of soluble insulin rarely lasts longer than eight to ten hours however large the dose Zinc protamine insulin continues its action for twenty-four hours when administered in quite moderate doses from 20 to 24 units, in larger doses it will continue to act even longer The fall in the blood sugar from zinc protamine insulin is more gradual than from soluble insulin, so that severe hypoglycaemia cannot occur soon after the injection, and the violent oscillations between hyper- and hypo-glycaemia sometimes experienced by severe diabetics on soluble insulin are eliminated These qualities are advantages

On the other hand, one obvious drawback arises from the slow absorption of zinc protamine insulin It does not enter the circulation rapidly enough to deal with sugar absorbed into the blood stream from a meal containing 40 or more grammes of carbohydrate Thus it is usual in a severe diabetic on a single morning dose of zinc protamine insulin to find blood sugars of 180 to 250 mg per 100 c cm of blood soon after food, while a few hours later the blood sugar is normal There is no return of ketosis with this hyperglycaemia after food Another disadvantage we have noted is considerable irregularity in action from day to day This is due, we suppose, to differences in the dispersion of the injections and in the vascularity of the surrounding tissues, so that the precipitate goes into solution and is absorbed at different rates The action of soluble insulin is much more regular from day to day, no doubt because it enters the general circulation so rapidly and completely

It seems clear that the normal secretion and action of insulin is not fully imitated either by the soluble or suspension insulins The probability is (Lawrence and Archer, 1936) that a constant small secretion of insulin from the normal pancreas keeps the endogenous sugar under control while an added intermittent secretion deals with the exogenous sugar absorbed from carbohydrate digestion The steady slow action of zinc protamine insulin imitates the small constant secretion but cannot control hyperglycaemia after much carbohydrate food On the contrary soluble insulin acts strongly and well when given balanced by carbohydrate but because of its evanescent action quickly allows endogenous hyperglycaemia to recur

A combination of the two types of insulin action is needed to turn the severe diabetic into a physiological individual and that has not yet been achieved by any single preparation The next best thing however is to mix soluble and suspension insulin in the correct proportions and give them at one injection, so that the soluble insulin controls the post prandial hyperglycaemia while the suspension insulin comes into action later in the day and keeps the blood sugar normal throughout the night So far a mixture of soluble and suspension insulin in one bottle has not been produced, but we have satisfied ourselves by clinical experiments that soluble and suspension insulin can be given in the same syringe and injected into the same place and each retains its characteristic action (see table)

Time	Case I Blood Sugar (mg per 100 c cm blood)		Case II Blood Sugar (mg per 100 c cm blood)

Breakfast 9 a m 50 grammes carbohydrate lunch 1 p m 30 grammes carbohydrate

Clinical Use of Zinc Protamine Insulin

We are convinced that zinc protamine insulin has passed the experimental stages and is ready for therapeutic application We are sure that one injection a day will maintain all but the most exceptionally severe diabetics in good health, but we are equally certain that we have not had enough experience to lay down hard and fast rules for its prescription We cannot do more than indicate how we have used it and the results we have obtained As with soluble insulin, it is essential to study each case individually to find the optimum dose and diet balance We should like to point out, too, that suggestions which seem sound to us from four months' experience may have to be considerably revised in the light of further studies

With the exception of one patient—who required 500 units a day of soluble insulin and is now stable on 90 units twice a day of zinc protamine insulin—all our patients on zinc protamine have been treated with one injection a day Since the action of suspension insulin is cumulative, three to six days must elapse before the true effect of any constant daily dose can be assessed

The Basal Dose

The first step is to discover what we have called the basal dose of insulin—that which will continue its action for twenty-four hours The correct dose is that which will cause no hypoglycaemia during the night and yet maintain the blood sugar at a normal level before breakfast next morning We have given 30 units before breakfast as a starting dose, and adjusted it up or down according to blood and urine tests

Where fasting blood-sugar estimations are not available two specimens of urine should be taken before breakfast one immediately on waking, to void any sugar which may have entered the bladder soon after bedtime, and a second just before breakfast, to indicate the approximate level of the blood sugar at that time Even when the first specimen contains sugar the second is often sugar-free indicating that the dose of zinc protamine insulin is sufficient to last the twenty four hours If the second specimen contains sugar the dose must be raised If there are any symptoms of hypoglycaemia—sweating palpitations, and trembling between midnight and breakfast—the basal dose is too high and must be reduced We [illegible]

DEATH FOLLOWING BLOOD TRANSFUSION

NOTES ON TWO CASES

BY

T. PYGOTT, M.B., D.P.H.

Late Assistant Resident Medical Officer, Mill Road Infirmary, Liverpool

Dr. N. S. Plummer (1936) has recently drawn the attention of the profession to the danger to life which may occasionally result from the transfusion of a patient with compatible blood. To the five cases he has reported I should like to add two more which have occurred within my own experience.

Case I.

This was a case of aplastic anaemia in which death followed within five minutes of a third transfusion. The patient was a male, aged 42 years, admitted to hospital complaining of increasing pallor and dyspnoea on exertion for one month. There was a past history of syphilis eighteen years before, but the Wassermann had become negative after treatment over a period of two years.

His nutrition was good, though he was extremely pale and anaemic. There was no oedema of the ankles. He gave no history of loss of blood from any source. There was no enlargement of liver, spleen or lymph glands. His pulse was regular and forcible. His heart was not enlarged clinically, and the sounds were regular and of good quality. His blood pressure was 175/95 mm. Hg. His urine contained no excess of urobilin; his icterus index was 5, and his blood Wassermann negative; his blood urea was 30 mg. per 100 c.cm. Examination of the blood on the first day of admission to hospital showed: red blood corpuscles 1,400,000; haemoglobin, 20 per cent.; colour index, 0·7; white blood corpuscles 5,000 per c.mm. A differential count revealed: polymorphonuclear leucocytes, 18 per cent.; small lymphocytes, 80 per cent.; large lymphocytes, 2 per cent. The blood group was II (Moss); the bleeding time half an hour, and the coagulation time five minutes.

He was given 90 grains of ferri et ammon. cit. daily. As he showed no signs of improvement 550 c.cm. of Group II. blood was administered by direct transfusion (Joubert method) on the seventh day after admission. No sequelae resulted. The day after the transfusion the blood count was: red blood corpuscles 1,300,000; haemoglobin 20 per cent.; colour index, 0·7; white blood corpuscles, 6,000 per c.mm.

On the tenth day there was a further direct transfusion of 550 c.cm. of Group II. blood; again no sequelae resulted. On the thirteenth day a blood count showed: red blood corpuscles 860,000; haemoglobin 12 per cent.; colour index 0·7; size of red cells 8·2 μ; white blood corpuscles 4,000 per c.mm.; polymorphs 27 per cent.; small lymphocytes, 69 per cent.; large lymphocytes 4 per cent. Haemorrhages were now to be seen in both fundi and round the margins of the lips. His blood icterus index was 3.

The third and fatal transfusion was on the fourteenth day after admission. It is important to mention that in spite of his low haemoglobin he was quite able to sit up in bed without assistance immediately before the transfusion was begun. As on the two previous occasions the direct method was used. After about 150 c.cm. of blood had been transfused he became increasingly restless. This restlessness had been observed on the two previous occasions at about the same stage of the operation but had passed off after a pause had been made. The operation was accordingly suspended for a minute or so and then encouraged by a slight improvement in the patient's condition a further 50 c.cm. of blood was introduced, making a total of 200 c.cm.

His condition was now alarming: respirations were becoming rapidly intermittent; his pupils were starting to dilate; the pulse was absent at the wrist and the heart sounds were faint. Intracardiac stimulants (adrenaline and strychnine) were of no avail, and death occurred within five minutes of the end of the operation.

Each transfusion was from a different donor, who was carefully grouped and whose blood was directly tested with that of the patient before each transfusion was started. Post mortem examination showed no abnormal changes in the lungs. The heart muscle was pale but otherwise normal, and there was no clot in either branch of the pulmonary artery. The spleen was normal in size. The kidneys were large (right 8 oz., left 11 oz.), and showed a mixture of chronic interstitial nephritis and toxic changes; microscopically there was extensive tubular damage and fibroid glomeruli.

Case II.

This was a case of pernicious anaemia in which death followed five hours after the first transfusion. The patient was a male aged 50 years. He was a typical case of pernicious anaemia, with early subacute combined degeneration of the spinal cord. He gave a history of increasing breathlessness on effort, tingling and numbness in the hands and feet, and loss of energy, but no loss of weight.

He was fairly well nourished, but anaemic, and his skin and conjunctivae had a subicteric tinge. His peripheral arteries were moderately sclerotic and his heart sounds were regular, but of only fair quality. His blood pressure was 125/75 mm. Hg. Examination of the chest revealed a mild generalized bronchitis. The only abnormalities found in the central nervous system were slight nystagmus, absent abdominal jerks, bilateral extensor plantar responses, and absent vibration sense in both legs.

His urine contained a trace of albumin but no excess of urobilin. No occult blood was found in the faeces. A fractional test meal showed a complete achlorhydria with no delay in emptying of the stomach. His blood Wassermann was negative, Group IV (Moss) and his blood count was: red blood corpuscles, 1,250,000; haemoglobin, 25 per cent.; colour index, 1; average size of corpuscle 8 μ; white blood corpuscles 2,500 per c.mm. A differential count showed: polymorphs 54 per cent.; small lymphocytes, 42 per cent.; large lymphocytes, 4 per cent.; nucleated red cells present in fair numbers. A urea clearance test gave the following results:

Blood urea at the end of the first hour, 85 mg. per 100 c.cm.
Concentration, 2·1 per cent.
Clearance, 29 c.cm.

That is, there was evidence of very definite renal damage.

He was given 5 c.cm. of campolon daily intramuscularly. It was thought that perhaps his improvement might be hastened by a transfusion. Accordingly, on the fourth day after admission he was given 550 c.cm. of Group IV. blood by the indirect (citrate) method. A transfusion service donor who had given blood on several previous occasions was used and the patient's and donor's blood were perfectly compatible when mixed directly before the transfusion.

There was no immediate reaction of any kind, but one hour later the patient complained of feeling cold and had a rise. He was given hot drinks, and he settled down again with no further complaints until four hours after the transfusion when he suddenly collapsed and went into a coma with cyanosis, dyspnoea, and a feeble pulse. His chest was then full of bubbling rales, and he died an hour later.

At necropsy the lungs were found to be oedematous. The heart was slightly dilated and its muscle was very flabby and showed a typical thrush breast appearance. There was a moderately severe degree of chronic interstitial nephritis. No other abnormalities were found, and no evidence of pulmonary embolism or clot formation in any of the larger vessels was demonstrated.

Classification.

While these deaths following transfusion are not common, they are nevertheless disturbing. It would therefore be as well to consider in a general way the groups of conditions in which a transfusion may be thought a reasonable adjunct to other therapy, and at the same time to classify the fatalities in the same way.

found in many cases this basal dose to be 20 to 30 units, in the more severe, 30 to 50 units

In the course of establishing the patient on the basal dose of zinc protamine insulin it becomes apparent to which type of diabetic he belongs The milder insulin case remains sugar-free throughout most of the day on his basal dose of suspension insulin Sometimes there is slight hyperglycaemia in the early forenoon, a time when the injection of the previous day is exhausted and that of the same day not established Fig 1 shows a series of blood sugar estimations on such a case throughout the day

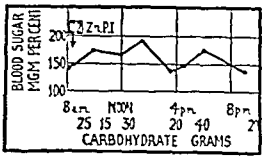

FIG 1—Blood sugar curve after twenty one days on zinc protamine insulin

The Addition of Soluble Insulin

The severe type of diabetic cannot be kept well controlled throughout the twenty four hours by a single dose of suspension insulin in the morning, and tends to pass large amounts of sugar, but not acetone bodies, after each meal This cannot be overcome by increasing the basal dose, because hypoglycaemia is certain to appear between bedtime and breakfast It can be mitigated by cutting down breakfast and lunch carbohydrate to a very low level, but this is undesirable and the patients naturally dislike it The obvious treatment is to give soluble insulin along with the basal dose of zinc protamine insulin and fortunately we have found that they can be mixed in one syringe and injected together, and yet retain their separate qualities of action (see table and Fig 2)

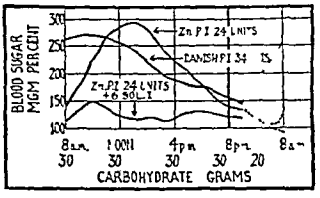

FIG 2 shows the effect of different insulins given at 8 a.m. Zinc protamine insulin 24 units acts longer than Danish protamine insulin 34 units but controls the day's carbohydrate food poorly The addition of soluble insulin rectifies this

If the urine is sugar free before breakfast a mixed dose should be administered almost immediately before food, as a longer interval may result in hypoglycaemia before the carbohydrate is absorbed Another plan we have tried is to inject the basal dose at bedtime instead of before breakfast In this way its minimum action coincides with the hours of sleep and its maximum with the intake of the day's food This has worked satisfactorily in six patients one patient had slight hypoglycaemia at 5 a.m. on a dose of 30 units at 10 p.m. When finally stabilized her basal dose proved to be 14 units The blood sugar is generally controlled for about eighteen to twenty hours, but the evening's carbohydrate meals lead to heavy glycosuria We think that most patients will be better controlled when given suspension insulin before breakfast rather than at bedtime When it is necessary to add soluble insulin to the basal dose this must be taken before breakfast, the mixed dose administered at night would certainly result in hypoglycaemia

Diet and its Arrangement

It has become the general practice to allow liberal amounts of carbohydrate in the diet of diabetics on insulin Diets containing 120 to 200 grammes of carbohydrate can be tolerated very satisfactorily on zinc protamine insulin, but the carbohydrate distribution must be carefully arranged It is customary with soluble insulin to order most carbohydrate at the two meals which follow the morning and evening injections 150 grammes (g) being taken as

Insulin Insulin
↓ Breakfast 50 g Lunch 30 g Tea 20 g ↓ Dinner 50 g

The action of a basal dose of zinc protamine insulin is slow in beginning gathers strength, acts for twenty-four hours, and may produce hypoglycaemia any time when no carbohydrate has been taken for three to five hours Therefore the carbohydrate must be spread throughout the day in smaller and more frequent feeds than were advised before We consider an afternoon tea and a bedtime feed essential to prevent hypoglycaemia A suitable arrangement of 150 grammes would be

Insulin
↓ Breakfast 30 g Lunch 30 g Tea 30 g Dinner 40 g
Bedtime 20 g

In severe cases, where soluble is added to suspension insulin, more carbohydrate should be given at breakfast time—for example, 50 grammes instead of 30 grammes Variations in the amount of carbohydrate at each meal should be made in each individual case to strike the best balance between glycosuria and hypoglycaemia

Hypoglycaemia

Soluble insulin exerts its main effect from three to six hours after injection and therefore its overdoses occur between these times The onset of hypoglycaemia from zinc protamine insulin is quite different, coming much later in the day Both have a later hypoglycaemic action when administered in large doses We have found that 15 to 25 units of zinc protamine insulin act most strongly eight to twelve hours after injection, a morning dose causing hypoglycaemia before tea or before dinner while 25 to 30 units act most strongly fourteen to twenty two hours after injection, causing hypoglycaemia during the early hours of the morning or even just before breakfast next day

Hypoglycaemia is more subtle in onset and on the whole subjective symptoms are less severe than with soluble insulin but we believe that the sense of security produced by these observations is a false one Preliminary symptoms of shakiness sweating and palpitation usually ascribed to an adrenaline reaction may be absent when the blood sugar is 40 to 60 mg per 100 c.cm. of blood On the few occasions that we have been able to take blood for sugar estimation when symptoms of hypoglycaemia were actually present, the blood sugar has been exceedingly low It was noticed that a patient was sweating and trembling a little when blood was taken from his ear one evening He said he noticed nothing himself except feeling rather cold The blood sugar concentration was 39 mg per 100 c.cm. of blood Thus the patient is liable to develop severe hypoglycaemic symptoms without warning This has happened to four of our patients at home, although never under hospital conditions The new treatment of these four was being worked out without admission to hospital, because this had seemed justifiable in view of their knowledge and experience as trained

The first big group of conditions for which blood transfusion is used universally is in the treatment of acute blood loss from any source If reference is made to the fatalities it is clearly seen that not one of them falls into this group Further I think it is generally agreed that transfusion in these conditions is never followed by any reaction to which death could be directly attributed Blood transfusion is employed so often in these cases, especially by the obstetrician, that had this not been so I feel sure that we should have found many more cases reported in the literature

In another large group the object of the transfusion is not to replace actual blood loss, but to stimulate blood formation The various anaemias both primary and secondary, obviously fall into this group Fatalities reported belonging to this group are (*a*) Plummer's Cases I to IV inclusive, (*b*) Carrington and Lee's case (1923), (*c*) both my cases

A third group of conditions consists of those in which the object is to stimulate the body's reaction to infection or toxaemia, either acute or chronic Case V in Dr Plummer's series falls into this group

Let us now consider the differences between the cases of the first large group and those of the second and third groups In the first group we have a perfectly normal cardiovascular system deprived of blood If we replace the blood lost the patient other factors being equal is in no worse state than he was before the onset of his haemorrhage In the second and third groups we have a cardiovascular system which has been injured to a greater or less degree, by a deficient oxygen supply over a long period or by toxaemia or by both in conjunction, here the amount of humoral fluid is at least normal To this system we add a strain in the shape of an increase in blood volume, and thus place an extra load upon an organ which is already relatively inefficient Fortunately the cardiac reserve is large enough to meet the demand in most cases and nothing happens, but in a few it is not, and even death may result

Possible Methods of Prevention

How then, may this strain be avoided? One practical suggestion is that before transfusion in these cases venesection should be performed, and only the same volume of blood transfused as has been removed The only possible alternative is to resort to frequent small transfusions which are often a nuisance to both patient and doctor and are naturally of very much less therapeutic value

In considering certain factors which are common to all three groups, anaphylaxis at once comes to mind This might suggest that it plays perhaps a smaller part in producing a fatal issue than that which Dr Plummer would accord it May I add in conclusion that it is my experience of direct transfusion that by increasing the rate of transfusion, especially after about 150 c.cm of blood has been given, it is possible to produce in almost any patient a fit of severe coughing, which rapidly ceases if the transfusion is stopped for a moment or two, and does not as a rule return even when the rate of transfusion is increased again I think this may be ascribed to a temporary over distension of the right auricle and until the distension of the auricles is equalized via the pulmonary circulation a certain amount of hold up on the right side of the heart results Once the cardiac output has been increased the constant addition of blood does not produce any significant effect upon the action of a normal heart

Towards the end of a moderately large direct transfusion it is quite common for the patient to complain of backache and to become somewhat restless, whether this is in some way connected with the accommodation of the added blood by the splanchnic circulation would be a difficult point to settle, it is certainly quite different in character from the early severe pain in the back associated with the transfusion of incompatible blood

Summary

1 Two cases of death resulting directly from transfusion with compatible blood are reported

2 The importance of recognizing the causes at work in producing possible fatalities is stressed

3 The mechanical rather than the anaphylactoid element is regarded as being the more important in their causation

4 It is suggested that a venesection might be performed before transfusion in certain cases

Clinical Memoranda

Gastric Perforation in a Tabetic

In acute abdomens' pain is usually the presenting symptom and its absence may have disastrous results I have been urged to publish the following case on account of its rarity and interest

CASE RECORD

I was called a short time ago to see a man aged 40 previously unknown to me who complained of vomiting and diarrhoea The onset had been acute the evening before following a motor cycle ride which had resulted in his becoming wet and thoroughly chilled No article of diet could be incriminated and there was no history of previous gastric trouble When seen he was sitting up in bed quite cheerful not obviously very ill and with no abdominal pain His temperature was 99 F pulse rate 84 The tongue was slightly furred the abdomen tender but not more so than one would have expected in a case of gastro enteritis of this degree nor was there more than slight rigidity The vomitus and faeces had not been kept the former had consisted at first of food and later of green bile, the faeces were liquid and pale He complained of pain increasing in severity across the back of his neck and shoulders

I diagnosed gastro enteritis aggravated and possibly caused by the chilling and fibrositis in the region of the trapezii from the same cause I decided not to give a purgative but prescribed a bismuth mixture and liniment The next day his general condition and physical signs were about the same except that the temperature was 102 F the pulse rate 96 Vomiting had ceased but the diarrhoea persisted The pain in the neck and shoulders was worse The day after that he appeared for the first time obviously ill He was collapsed blue and sweating with a temperature of 97 F and pulse rate 120 there was still no abdominal pain but the neck and shoulder pain persisted I had him removed to the Buchanan Hospital St Leonards where he was seen by Mr J A Kerr F.R.C.S. who confirmed the physical signs and advised continuation of medical treatment The man's condition grew rapidly worse however and he died the following day

Necropsy showed to our astonishment perforation of a large gastric ulcer on the lesser curvature of the stomach with of course generalized peritonitis In course of time the man's panel record card was forwarded to me I then found out that (as I had tentatively suggested after the

diabetics The experience has warned us against changes to the new insulin except under close observation The possibility of severe hypoglycaemia is certainly not eliminated with suspension insulin

Beginning Treatment in New and Old Cases

It must be remembered that zinc protamine insulin is slow in coming into action, and a constant dose does not show its full cumulative effect for three to six days It is advisable, therefore, at the beginning to prescribe soluble insulin as well—at all events if we wish to assess the final dosage quickly in hospital or a nursing home

In new untreated cases loaded with sugar and acetone we give a moderate dose of soluble insulin, 10 to 20 units, either before the evening meal or with the morning basal dose of 30 units of zinc protamine insulin, and sometimes in severe cases at both times to bring the sugar quickly under control These added doses of soluble insulin are diminished in two to four days, when the full effect of the basal dose is established Soluble insulin is omitted altogether in the milder cases, but will be necessary permanently in the more severe types, and is administered in the morning to assist the basal dose of suspension insulin

In transferring old insulin cases to one dose of zinc protamine insulin the continuation of some soluble insulin for two or three days is necessary if a heavy relapse of sugar is to be avoided Usually we try as a basal dose three quarters of the previous total dose of soluble insulin, seldom more than 40 units, with the addition of half the previous morning dose of soluble insulin The latter addition will gradually be adjusted, reduced, or omitted as the basal dose comes into full action We must repeat, however, that every case should be watched closely at this stage and judged by the results of urine and blood tests With our meagre experience we cannot lay down any definite rules for making the change quickly which may not either produce unnecessary hypoglycaemia or allow too severe a relapse in the diabetes We feel, and experiences from America agree, that the change in severe insulin cases should be made under close observation to avoid danger and to get the best results

Comparative Dosage of New and Old Insulin

When large doses of soluble insulin are given to severe diabetics much is wasted either by destruction in the tissues or more probably by excretion in the urine The wastage of the slowly absorbed suspension insulin is much less The basal dose is likely to be at most only some 75 per cent of the total previous insulin dosage, sometimes we have found it considerably less The addition of small amounts of soluble insulin necessary in some cases is still likely to leave the total number of units less in the new than in the old treatment We have had to use far smaller doses of zinc protamine insulin than of Leo insulin retard in cases which we tried to control on one big morning dose alone

Insulin in Diabetic Coma

Urgent clinical ketosis demands rapid insulin action, and for this reason soluble insulin is often given intravenously to patients in diabetic coma Whether zinc protamine insulin intravenously is as efficacious we do not yet know until this is established the old methods of treatment must stand as best

We have found that zinc protamine insulin is very useful in the treatment of diabetic coma when injected subcutaneously in addition to intravenous or subcutaneous soluble insulin The suspension insulin administered at the beginning of treatment comes into action six or eight hours later, maintaining, by checking any recurrence of hyperglycaemia, the improvement already secured by the soluble insulin

General Observations

New severe cases stabilized on one injection daily of zinc protamine insulin show the same marked clinical improvement as similar cases treated with several injections daily of soluble insulin Ketosis and all acute symptoms of diabetes disappear within two or three days, glycosuria and hyperglycaemia more slowly The usual rapid gain in weight of four to ten pounds is seen in the first week, and energy and health are rapidly restored Those who wish it return to their ordinary life and full occupation in two to three weeks As has been the case before, such newly treated diabetics gain considerable carbohydrate tolerance, and the insulin can be reduced in the following weeks

A striking feature is complete absence of ketosis throughout the twenty-four hours, much more complete than we have ever obtained by three doses of soluble insulin in severe cases of diabetes Even during the period of hyperglycaemia and glycosuria after a meal there is no recurrence of ketonuria as judged by the sensitive nitroprusside test It appears that the worst defect of diabetes the endogenous production of new sugar and acetone bodies, is incomparably better controlled than ever before

Exercise raises important considerations in the use of the new insulin It is well recognized that unusual exercise makes diabetics on soluble insulin more liable to hypoglycaemia, but this is limited to the time of its maximum action, which can be foreseen and avoided Suspension insulin, however, with its prolonged action will make unusual exercise apt to produce hypoglycaemia at almost any time of the day and this should be prevented by giving extra carbohydrate before or during exercise This is more rational than a reduction of the basal dose, because an adequate reduction of the latter would permit recurrent hyperglycaemia next morning So far we have had no difficulties with patients leading an active life, one being a strenuous engineer mechanic and another playing football one afternoon every week

As usual, new cases coming for treatment soon after onset respond best and are most easily managed Severe diabetics who have already received soluble insulin over a long period require close study during the change over to zinc protamine insulin In two such cases treated as out-patients the new treatment had to be stopped on account of irregular action of suspension insulin which allowed heavy glycosuria on some days and severe hypoglycaemia on others for no obvious reason

We would hesitate to change to suspension insulin the large number of patients who are well controlled in perfect health and do not mind two injections a day of the soluble insulin This applies especially to those whose conditions of life are very irregular, as they would be exposed to the danger of hypoglycaemia whenever they missed a carbohydrate meal necessary to balance the late action of zinc protamine insulin We would remind readers of the irregularity of action from day to day which zinc protamine insulin as well as Danish protamine insulin shows when compared with soluble insulin Of any one day tests which are better or worse than the average may be obtained, and caution in raising or lowering the basal dose on one day's testing should be observed

From what we have seen of the long action of zinc protamine insulin it seems unlikely that a still longer

necropsy) he had suffered from tabes dorsalis, having completed a course of treatment nine months before.

This case affords an interesting illustration of the separate phrenic nerve supply of the diaphragmatic peritoneum, while from the clinical aspect two points call for comment.

1. In the absence of abdominal pain and rigidity a tabetic (even when known to be such) runs a grave risk of misdiagnosis should an intra-abdominal disaster occur.

2. The condition of shock found in cases of perforated gastric ulcer would seem to be due in the early stage almost entirely to the pain, and only later to toxæmia.

St. Leonards-on-Sea C. M. CARR, M.B., B.Chir.

Recurrent Idiopathic Herpes Zoster

A retired educationist, aged 66, came to see me on January 14 with the remains of an eruption of herpes zoster occupying the seventh dorsal segment on the right side.

CASE REPORT

The eruption had appeared about a fortnight previously and was preceded and attended by a considerable degree of pain. When seen by me there were a few excoriated areas left by blisters, the distribution of these being in three principal parts of the segment—the anterior, lateral and posterior areas described by Head. The patient felt "ill" but was able to go about throughout the attack and at the time of his visit all the symptoms were definitely diminishing, and the herpes zoster was clearly running a normal course.

No history of varicella or of herpes zoster in other persons in his family was obtainable, either before or after the attack was noticed. The patient is a remarkably healthy man and at no time in his life has he had arsenical treatment.

Upon stripping the patient it was at once obvious that there had been a previous eruption of herpes zoster occupying the seventh left dorsal segment—that is to say, at precisely the same level as the present attack but on the opposite side of the body. The scars left by the previous eruption indicated a much more severe attack than the present one, and their distribution again obtained a maximal measure in the three areas anterior, lateral and posterior. The character and distribution of the scars left no possible doubt as to their causation and the patient stated that he had had a very severe attack of the same nature as the present only much more painful and prolonged in the spring of 1915. He further volunteered the interesting information that his mother, on the occasion of the attack in 1915, assured him that he had had a similar attack at the age of 4 years, but the patient could not give any further information as to the position of this earlier eruption nor were there any scars to indicate its distribution.

COMMENTARY

In recording instances of recurrence as idiopathic herpes zoster the most meticulous care must be taken to avoid (1) confusion of the eruption with herpes simplex, a common mistake, (2) confusion with traumatic herpes and (3) confusion with arsenical herpes. By idiopathic herpes zoster I mean the condition described by Head in his classical paper (*Brain*, 1900) as "an acute specific disease of the nervous system," which indeed he compared with what he called the "exactly analogous disease," acute anterior poliomyelitis. He wrote:

> Some agent of the nature of which we are ignorant chooses the substance of the posterior root ganglion for its selective activity, producing profound inflammatory changes. These destructive changes in the ganglion produce irritation of its nerve elements, and to this irritation is due the eruption on the skin.

Head differentiated this primary type from others in the following terms:

> It is interesting to find that acute inflammation of a posterior root ganglion, due to its implication in some local inflammatory process, can apparently produce an herpetic eruption indistinguishable from an eruption which arises as a manifestation of the acute specific disease."

In this category are to be placed the cases resulting from the use of arsenical preparations producing a type of eruption indistinguishable from idiopathic herpes zoster but clearly to be differentiated from it. Herpes of this causation is not infrequently recurrent.

It is important to avoid acceptance of any but the most positive evidence of the previous attack, evidence such as is afforded by the presence of the characteristic distribution of scars being much more convincing than any statement made by the patient. When a proper measure of care in investigation is taken a recurrent idiopathic herpes zoster is found to be extremely rare, and therefore I record this case. In a long experience I can recall only one other personal observation, which occurred in a medical man whom I saw with an active eruption of idiopathic herpes zoster at the age of 50. I was able to identify scars of a previous attack upon the other side of the body, and not at the same level, which the patient dated as having occurred when he was 10 years of age. I have met with no record of a recurrent attack at the same level upon the opposite side of the body, but simultaneous bilateral eruptions at the same segmental level have been noted. They have been observed chiefly in association with severe injury or disease involving the whole thickness of the spinal cord and consequently such cases have been generally fatal, thus confirming the widely entertained popular belief that "shingles which meets round the body portends death." Cases of non-fatal traumatic herpes may show frequent recurrence as in the following instance. A friend and colleague of mine, while an undergraduate at Cambridge, fractured one of the upper cervical vertebræ, after a long illness he recovered completely from the injury but from time to time throughout his life he was subject to herpetic eruptions attributable to recurrent inflammations, accompanied by pain, at the site of injury.

London, W.1 E. GRAHAM LITTLE.

Paralysis of Accommodation as the Result of Internal Administration of Stramonium

The following note of a case may prove interesting to general practitioners as well as to ophthalmic surgeons. Tincture of stramonium contains small amounts of atropine and hyoscine.

A girl aged 13, an in-patient at University College Hospital with asthma and bronchitis, was referred to the ophthalmic department on October 29, 1936, complaining of difficulty when reading. The pupils were moderately large, and their reaction to direct light not very brisk. New glasses had been provided from an outside source in July 1936. The right vision with glass was 6/9, left vision with glass 6/9. With glasses she was able to read small print at eighteen inches but not at fourteen inches distance.

On inquiry it was found that this patient had been taking a mixture containing potassium iodide 4 grains, tinct. stramon. 20 minims, spt. lobeliæ æth. 10 minims, syrup of tolu and aq. chlorof. three times daily from October 17—that is for a period of twelve days.

On November 2 she was able to read Jaeger 6 with no difficulty at twenty-four inches and not nearer with her glasses. The distance vision was as before and no additional plus minus sphere was accepted by either eye. On November 9 the pupils were smaller and she could read with either eye with her glasses Jaeger 1, at as short a distance as five inches—after having been without the medicine for three days.

London, W. HUMPHREY NLAME, L.R.C.S.

acting insulin—to be injected, let us suppose, once a week—could ever be successful: it would cause hypoglycaemia every night, and the patient's condition would be comparable to the rare syndrome of spontaneous hypoglycaemia. It is clear that the basal dose must be "tailing off" in strength of action at night.

Summary

1 The chemical nature and physiological action of zinc protamine insulin is described.

2 We have used it as one dose a day, from 16 to 50 units, in forty-two insulin patients of all grades of severity. In all cases the urine passed twenty-four hours afterwards can be made sugar-free and the blood sugar normal or nearly so. In many severe cases hyperglycaemia and glycosuria after carbohydrate meals, especially breakfast, cannot be controlled by such a dose of zinc protamine insulin alone, but can be better regulated by the addition of a suitable dose of soluble insulin injected in the same syringe.

3 The adjustment of diet, the dosage of insulin, and the possibility and prevention of hypoglycaemia are discussed. We consider that careful study of each case is essential.

4 We conclude, so far as our limited experience goes, that most severe diabetes can be well controlled and the patient maintained in excellent health by one injection a day, either of zinc protamine insulin suspension alone or with the addition of some soluble insulin. The initial stages of such treatment should be carried out under close observation.

We wish to thank our patients for their keen co-operation and the nursing staff and the dietetic and laboratory staff in our department for loyal assistance in the extra work which these studies have required. We are indebted to Professor Best of Toronto for our first supply of zinc protamine insulin and to Messrs. Boots Pure Drug Co. Ltd. who have supplied large quantities free since November 1936.

M. Schubert (*Derm. Wschr.* December 19, 1936, p. 1653) believes with Miescher, Musger, and Kogoj that lichen sclerosus atrophicans represents an idiopathic affection having the following characteristics: some spots are rounded or polygonal, of irregular but well-defined outlines. Their colour is bluish white. They are either of the same level as the surrounding skin or slightly prominent or inversely slightly sunk. The surrounding skin is not red, but may show a slightly pigmented ring. Some of the spots develop into verrucous foci of grey brownish colour with more or less extensive whitish margins. Small spots may coalesce to form large irregular but well-delimited foci of the colour of porcelain. There are also sunk smooth white, rounded scars with fine telangiectases. The affection can be distinguished both clinically and histologically from lichen ruber planus and from the circumscribed sclerodermia although there are transitional forms between lichen sclerosus atrophicans and the last-named two affections. The author prefers to call the disease "lichen sclerosus atrophicans" rather than "white spot disease" (Weissfleckenkrankheit).

THE NOCIFENSOR SYSTEM OF NERVES AND ITS REACTIONS*

BY

SIR THOMAS LEWIS, M.D., F.R.C.P., F.R.S.

Physician to University College Hospital, London

LECTURE II

The three reactions described in the first lecture were all discovered by observations carried out exclusively upon human subjects. The fourth, to which I now come, was first described in animals, and has been submitted to close experimental investigation in these.

4. The "Antidromic" Flush

The first definite statement of vasodilator nerves in the posterior roots was made by Stricker in 1876. But his observations remained unaccepted until Bayliss's careful experiments were recorded in 1901. Bayliss (1900–2) found that stimulation of the distal ends of the cut posterior roots by current, or mechanically, produces a long-lasting vasodilatation of the limb supplied. He showed that the cell stations of the fibres conducting the impulses to the vessels lie in the posterior root ganglia, for the effect remains after the posterior roots are cut but is lost after the ganglia are excised. He concluded that the fibres concerned are the ordinary sensory afferent fibres of the posterior roots and that vasodilatation of the limb is effected by antidromic conduction, as he called it at Langley's suggestion. Similar vasodilatation can be produced by stimulating the distal ends of nerves to the limbs or cutaneous nerves, and these reactions have been studied by Langley (1923–4) and by myself and others (Lewis and Marvin, 1927), mainly in the cat's paw. Foerster has shown in recent years that reddening of the human skin over appropriate segments occurs when the posterior roots or nerves of the limb running to the skin have been cut and are stimulated distally. In the case of the cat stimulation of a small nerve of the paw flushes the bare surfaces of those pads which the particular nerve supplies, and flushes them sharply to a boundary. Langley first observed this, and, adopting my method of identifying active capillary dilatation, found that the flushing is produced even during circulatory arrest. He therefore, and rightly, concluded that the flush is due to capillary rather than to arteriolar dilatation in this animal.

The conception that the vasodilatation is due to antidromic conduction in sensory nerve fibres was grounded upon the contemporary belief that all posterior root fibres are afferent. Several workers (Ranson, Kure, Tower) have since described intact fibres in the spinal ends of the cut posterior roots many days after section. These have been much discussed and have generally been regarded as regenerated from the root ganglion. But Kahr and Sheehan (1933) traced intact fibres in this root after removing the ganglia, and Barron and Matthews (1934–5) have recently supplied some remarkable evidence, both physiological and anatomical, that fibres having their cell stations in the posterior root ganglia pass into the cord and send collaterals out again through neighbouring posterior roots on their way to the periphery. It seems from the observations of Matthews that these fibres normally carry impulses out to the periphery, but if that is so then it is difficult to regard the system of nerves in question as subserving a sensory function. Thus the evidence from this source inclines us to recognize that there are fibres other than sensory in the posterior

* The Hume Lectures, delivered at Newcastle on Tyne, February 4 and 11. Lecture I was published last week.

Reviews

THE EXTRA PHARMACOPOEIA

Martindale's Extra Pharmacopoeia Vol 1 Twenty first edition In two volumes (Pp 1182 27s 6d) London The Pharmaceutical Press 1936

Martindale's *Extra Pharmacopoeia* is so well known to the medical profession that it is unnecessary to give any account of its general scope and purpose The twenty-first edition of the first volume is, however, of special interest because it is the first edition of this part of the work to appear under the management of the Pharmaceutical Society The first *Extra Pharmacopoeia* was produced in 1883 by William Martindale and W Wynn Westcott, these editors died in 1902 and 1925 respectively and W H Martindale, the son of the former, carried on the self imposed duty until his death in 1933, not long after the appearance of the twentieth edition of the first volume in 1932 The task of editing the volume had become more than any one man could manage but fortunately for the medical profession the continuance of this invaluable work of reference was undertaken by the Pharmaceutical Society, who appointed a revision committee with Mr C E Corfield as editor This committee brought out the twentieth edition of the second volume in 1935, and has now produced the twenty-first edition of the first volume

When the *Extra Pharmacopoeia* made its bow in 1883 synthetic drugs were just beginning to invade therapeutics in substantial numbers but ever since that date their numbers have increased by geometrical progression, furthermore the appearance of endocrine and vitamin preparations has helped in swelling the number of substances available for therapeutic use As a result the task of the editors has changed completely half a century ago the essential point was to give an adequate account of all drugs likely to be used by doctors, whilst to-day the problem is how to compress into a pocket volume a reasonable proportion of the material available Perhaps the most significant fact about the present edition is that the editors have succeeded in effecting a small reduction in the number of pages In view of the quantity of new drugs and preparations that have emerged in the last five years this is a notable achievement The preface states that the whole of the material has been examined exhaustively with the object of removing matter of little or no value and perusal of the volume shows that a drastic revision has in fact been made The subject-matter has been largely rearranged and reclassified and one useful change is the abolition of the supplementary list of drugs, which had shown a tendency to degenerate into something like a rubbish heap We note also that a thorough weeding of the references has been effected

The essential feature of a volume of this kind is that it should give an up to date and impartial account of the properties of important new drugs Examination of the text shows that it contains good accounts of all important new drugs even when these have only appeared during the past year For example more than a page is devoted both to protamine insulinate and to prontosil Examples of other advances made in the last five years which are described are mandelic acid stebrin musonate ergometrine evipan and a number of new hormones and vitamin preparations

There can be no doubt that the *Extra Pharmacopoeia* is becoming of more and more importance to the medical profession The rate of progress in therapeutics has quickened greatly in recent years and hence information about recent preparations is more necessary At the same time the mere number of new preparations and still more the number of new proprietary names makes some encyclopaedic work of reference essential The impartiality of the *Extra Pharmacopoeia* is also an important feature There is no need to enlarge on the peculiar difficulties which commercial enterprise in the sale of drugs presents to the medical profession Every doctor is deluged with a flood of advertisements by post, which range from accounts of important new therapeutic advances to endeavours to promote the sale of worthless rubbish No practising doctor has the time to hunt through the polyglot original literature which indeed varies in quality almost as widely as do the advertisements The *Extra Pharmacopoeia* provides an exhaustive and unbiased account of the status of these preparations, and for this reason will be found invaluable by the medical profession

CLINICAL ENDOCRINOLOGY

Endocrinology in Modern Practice By William Wolf M D M S Ph D (Pp 1018, 235 figures 42s net) Philadelphia and London W B Saunders Company 1936

So many books have appeared of recent years on the subject of endocrinology that the practitioner would naturally wish to know what are the special features of Dr William Wolf's *Endocrinology in Modern Practice* We would select two The first is the careful tabular summaries at the end of each section, from which the reader can quickly gather the physiology and pathology characteristic of each endocrine gland and can then refer back to the more detailed account of the particular point in which he is interested The second is perhaps more individual about 180 pages are devoted to the endocrine aspects of 'non endocrine' diseases, which should be a valuable guide to determining whether the condition with which the practitioner is faced is primarily due to a disorder of the endocrine system or whether it is merely incidental to a more general disease In these days of specialism this should serve as a useful corrective to an uncritical tendency to force the clinical picture to conform to preconceived ideas

The section on diagnosis is constructed on a practical plan with a suggested order of examination and an interpretation of the value of laboratory findings We would specially call attention to the chapter on bone development Not many of us can carry in our memories the dates of the appearance of centres of ossification or of epiphyseal junctions The series of skiagrams illustrating such facts form a valuable picture gallery for ready reference Delay or undue acceleration in these processes can thus be easily detected

There are a few points of detail which call for emendation in any subsequent edition The association of the pituitary sex hormone with the basophil cells is by no means so generally accepted as one would gather from this book and we failed to find any reference to Crookes's work on the hyaline change in these cells which occurs whatever other endocrine structure is involved in Cushing's syndrome It is not clear whether the author regards gastrin as an independent substance or merely identical with histamine, as is now generally thought Antihormones are not the same thing as chalones Sharpey Schafer introduced the latter term for a hormone which exerted a relaxing or inhibitory action Thus adrenaline is a hormone to the plain muscle of the blood vessels but a chalone to the plain muscle of the intestine This is not

diabetics The experience has warned us against changes to the new insulin except under close observation The possibility of severe hypoglycaemia is certainly not eliminated with suspension insulin

Beginning Treatment in New and Old Cases

It must be remembered that zinc protamine insulin is slow in coming into action, and a constant dose does not show its full cumulative effect for three to six days It is advisable, therefore, at the beginning to prescribe soluble insulin as well—at all events if we wish to assess the final dosage quickly in hospital or a nursing home

In new untreated cases loaded with sugar and acetone we give a moderate dose of soluble insulin, 10 to 20 units, either before the evening meal or with the morning basal dose of 30 units of zinc protamine insulin, and sometimes in severe cases at both times to bring the sugar quickly under control These added doses of soluble insulin are diminished in two to four days, when the full effect of the basal dose is established Soluble insulin is omitted altogether in the milder cases, but will be necessary permanently in the more severe types and is administered in the morning to assist the basal dose of suspension insulin

In transferring old insulin cases to one dose of zinc protamine insulin the continuation of some soluble insulin for two or three days is necessary if a heavy relapse of sugar is to be avoided Usually we try as a basal dose three quarters of the previous total dose of soluble insulin, seldom more than 40 units, with the addition of half the previous morning dose of soluble insulin The latter addition will gradually be adjusted, reduced, or omitted as the basal dose comes into full action We must repeat, however that every case should be watched closely at this stage and judged by the results of urine and blood tests With our meagre experience we cannot lay down any definite rules for making the change quickly which may not either produce unnecessary hypoglycaemia or allow too severe a relapse in the diabetes We feel, and experiences from America agree that the change in severe insulin cases should be made under close observation to avoid danger and to get the best results

Comparative Dosage of New and Old Insulin

When large doses of soluble insulin are given to severe diabetics much is wasted, either by destruction in the tissues or more probably by excretion in the urine The wastage of the slowly absorbed suspension insulin is much less The basal dose is likely to be at most only some 75 per cent of the total previous insulin dosage, sometimes we have found it considerably less The addition of small amounts of soluble insulin necessary in some cases is still likely to leave the total number of units less in the new than in the old treatment We have had to use far smaller doses of zinc protamine insulin than of Leo insulin retard in cases which we tried to control on one big morning dose alone

Insulin in Diabetic Coma

Urgent clinical ketosis demands rapid insulin action, and for this reason soluble insulin is often given intravenously to patients in diabetic coma Whether zinc protamine insulin intravenously is as efficacious we do not yet know until this is established the old methods of treatment must stand as best

We have found that zinc protamine insulin is very useful in the treatment of diabetic coma when injected subcutaneously in addition to intravenous or subcutaneous soluble insulin The suspension insulin administered at the beginning of treatment comes into action six or eight hours later, maintaining, by checking any recurrence of hyperglycaemia, the improvement already secured by the soluble insulin

General Observations

New severe cases stabilized on one injection daily of zinc protamine insulin show the same marked clinical improvement as similar cases treated with several injections daily of soluble insulin Ketosis and all acute symptoms of diabetes disappear within two or three days, glycosuria and hyperglycaemia more slowly The usual rapid gain in weight of four to ten pounds is seen in the first week, and energy and health are rapidly restored Those who wish it return to their ordinary life and full occupation in two to three weeks As has been the case before, such newly treated diabetics gain considerable carbohydrate tolerance, and the insulin can be reduced in the following weeks

A striking feature is complete absence of ketosis throughout the twenty-four hours, much more complete than we have ever obtained by three doses of soluble insulin in severe cases of diabetes Even during the period of hyperglycaemia and glycosuria after a meal there is no recurrence of ketonuria as judged by the sensitive nitroprusside test It appears that the worst defect of diabetes the endogenous production of new sugar and acetone bodies, is incomparably better controlled than ever before

Exercise raises important considerations in the use of the new insulin It is well recognized that unusual exercise makes diabetics on soluble insulin more liable to hypoglycaemia, but this is limited to the time of its maximum action, which can be foreseen and avoided Suspension insulin, however, with its prolonged action will make unusual exercise apt to produce hypoglycaemia at almost any time of the day and this should be prevented by giving extra carbohydrate before or during exercise This is more rational than a reduction of the basal dose, because an adequate reduction of the latter would permit recurrent hyperglycaemia next morning So far we have had no difficulties with patients leading an active life, one being a strenuous engineer mechanic and another playing football one afternoon every week

As usual, new cases coming for treatment soon after onset respond best and are most easily managed Severe diabetics who have already received soluble insulin over a long period require close study during the change over to zinc protamine insulin In two such cases treated as out-patients the new treatment had to be stopped on account of irregular action of suspension insulin which allowed heavy glycosuria on some days and severe hypoglycaemia on others for no obvious reason

We would hesitate to change to suspension insulin the large number of patients who are well controlled in point of health and do not mind two injections a day of the soluble insulin This applies especially to those whose conditions of life are very irregular, as they would be exposed to the danger of hypoglycaemia whenever they missed a carbohydrate meal necessary to balance the long action of zinc protamine insulin We would remind readers of the irregularity of action from day to day which zinc protamine insulin as well as Danish protamine insulin shows when compared with soluble insulin One any one day tests which are better or worse than the average may be obtained, and caution in raising or lowering the basal dose on one day's testing should be observed

From what we have seen of the long action of zinc protamine insulin it seems unlikely that a still long-

the sense in which Collip uses the term antihormone, which, like other antibodies, he regards as produced in answer to the administration of a hormone It is difficult to see why the organism should produce an antibody to one of its own products, and it would appear to limit the usefulness of organotherapy But a discussion of the theory of hormone-antihormone balance would lead us too far afield

ORGANIC CHEMISTRY

Recent Advances in Organic Chemistry By Alfred W Stewart, D Sc Vol II With the addition of Part II by Hugh Graham, D Sc Sixth edition (Pp 519 21s) London Longmans, Green and Co 1936
Reactions of Organic Compounds By Wilfred John Hickinbottom, D Sc, Ph D, F I C (Pp 449 16s) London Longmans, Green and Co 1936
Organic Chemistry for Medical Students By George Barger, D Sc, LL D F R S, M D (Hon) Second edition (Pp 251 10s 6d) London Gurney and Jackson 1936

The second volume of a new edition of Stewart's *Recent Advances in Organic Chemistry* is now before us The speed with which organic chemistry has advanced in its contact with physiology, pathology, and therapeutics has been so rapid in immediately recent times that a very large number of important substances are now well known as to their molecular constitution which but lately were known only by association with their origins or uses Among these may be mentioned the vitamins, the hormones, certain glycosides which exert an influence on the action of the heart, the sterols, and the bile acids The molecular configuration of many of these is now well established, and calls for the attention of all who study the relation of physiological activity to chemical structure It is true that molecular structure does not teach all that could be desired A chapter of the book is printed under the title "Structural Formulæ and their Failings,' but at the present stage of learning this is all that is to be had The new edition contains a supplementary section, written by Dr Graham, describing the most recently completed establishments of chemical constitution in the groups mentioned above The book deals comprehensively with the advances in all other fields of organic chemistry and, besides describing the knowledge established, it gives a readable account of the procedure followed and of the methods used in the attainment of the knowledge The description is accompanied by a discussion of the theories which are either accepted or are tentatively proposed regarding the questions and problems encountered A special chapter of considerable interest deals with theories of the natural synthesis of vital products

Hickinbottom's *Reactions of Organic Compounds* furnishes a general treatment of the subject of organic chemistry, but the treatment is approached from a different side from the ordinary In this book the author's aim has been to give direct assistance to the laboratory worker in problems arising out of analysis as well as synthesis Whereas in the realm of inorganic chemistry this aspect of instruction has from early times been put foremost, it has been largely otherwise in the organic field The cause is no doubt due to the different conditions inherent in the two branches of chemistry and to the difficulties attending any scheme of treatment of organic chemistry which should be comparable with that applied to inorganic All the more credit is therefore owed to Dr Hickinbottom for breaking ground in this direction He has chosen for description on the synthetical side the more exemplary cases gathered from researches in the production of many of the more complex compounds of typical character, including the classical methods which are generally well known and used for substances of simpler constitution He has dealt informatively with the conditions necessary to avoid interference from secondary reactions, and wherever these take a form amenable to control he shows how they may be directed to the accomplishment of another purpose The recognition of organic compounds is treated in an appendix, which provides a scheme for distinguishing identities by the observation of physical properties and by their behaviour in response to a series of general tests which are specific regarding type of constitution

Professor Barger's *Organic Chemistry*, written especially for medical students, was noticed on its first appearance in our issue of June 10, 1932 This is a book well suited to the purpose for which it is intended and we are not surprised that a second edition is called for The opportunity has been taken of making a number of minor alterations and additions, and several of the diagrams have been redrawn The last pages have been rewritten to indicate the enormous advances made recently by organic chemistry in the fields of vitamins and hormones

THE FIELD OF THERAPEUTICS

Traité de Thérapeutique Clinique Three volumes By Paul Savy (Pp 2 716 Broché, 300 fr, cartonnés toile, 360 fr) Paris Masson et Cie 1936

A treatise in three volumes, extending to nearly three thousand pages, professing to cover the entire field of therapeutics, and written by one and the same pen may not unreasonably be described as an event Such is a general description of Professor Paul Savy's book Its details are obviously beyond a reviewer's space but a fairly full consultation of its pages justifies the conclusion that nothing is wanting for anyone who desires to make the subject of therapeutics a matter of earnest and sustained study The book is not a compilation of the views and proposals of various writers, neither has it the properties of a ready-reference dictionary On the contrary, it rests upon the author's personal clinical experience and reflects his considered advice and judgement as these have been formulated and presented under the responsibility of many years of bedside teaching Hence, while the argument is systematic and organized it is alive with the note of personal observation and conviction, and it has the appeal and attraction both of an effective exposition and of literary charm The book is emphatically one to be read rather than regarded as a timely refuge in a difficulty or an emergency, and anyone who treats it in this fashion will not be without his reward

Professor Savy applies the term "therapeutics" in the widest and most comprehensive sense, even surgical proposals and their respective merits are included in his pages and he will not allow that these are entirely a question for his surgical colleagues In part therapeutics means the construction of formulas or prescriptions and these take a due position in the teaching of the several chapters, among their virtues may be mentioned simplicity directness, and removal from the cultivation of polypharmacy, and they are reasoned rather than imposed Altogether Professor Savy's volumes are both an inspiring achievement and a substantial gift to the application of the art of medicine over a wide field Those who read the introduction, entitled "Le Scepticisme en Thérapeutique," will hardly resist the chapters which follow

acting insulin—to be injected, let us suppose, once a week—could ever be successful, it would cause hypoglycaemia every night, and the patient's condition would be comparable to the rare syndrome of spontaneous hypoglycaemia. It is clear that the basal dose must be tailing off" in strength of action at night.

Summary

1 The chemical nature and physiological action of zinc protamine insulin is described.

2 We have used it as one dose a day, from 16 to 50 units, in forty-two insulin patients of all grades of severity. In all cases the urine passed twenty-four hours afterwards can be made sugar-free and the blood sugar normal or nearly so. In many severe cases hyperglycaemia and glycosuria after carbohydrate meals, especially breakfast, cannot be controlled by such a dose of zinc protamine insulin alone, but can be better regulated by the addition of a suitable dose of soluble insulin injected in the same syringe.

3 The adjustment of diet, the dosage of insulin, and the possibility and prevention of hypoglycaemia are discussed. We consider that careful study of each case is essential.

4 We conclude, so far as our limited experience goes, that most severe diabetes can be well controlled and the patient maintained in excellent health by one injection a day, either of zinc protamine insulin suspension alone or with the addition of some soluble insulin. The initial stages of such treatment should be carried out under close observation.

We wish to thank our patients for their keen co-operation and the nursing staff and the dietetic and laboratory staff in our department for loyal assistance in the extra work which these studies have required. We are indebted to Professor Best of Toronto for our first supply of zinc protamine insulin and to Messrs. Boots Pure Drug Co. Ltd. who have supplied large quantities free since November 1936.

M. Schubert (*Derm. Wschr.* December 19, 1936, p. 1653) believes with Miescher, Musger, and Kogoj that lichen sclerosus atrophicans represents an idiopathic affection, having the following characteristics: some spots are rounded or polygonal, of irregular but well-defined outlines. Their colour is bluish white. They are either of the same level as the surrounding skin or slightly prominent or inversely slightly sunk. The surrounding skin is not red, but may show a slightly pigmented ring. Some of the spots develop into verrucous foci of grey brownish colour with more or less extensive whitish margins. Small spots may coalesce to form large irregular but well-delimited foci of the colour of porcelain. There are also sunk, smooth white, rounded scars with fine telangiectases. The affection can be distinguished both clinically and histologically from lichen ruber planus and from the circumscribed scleroderma although there are transitional forms between lichen sclerosus atrophicans and the last-named two affections. The author prefers to call the disease 'lichen sclerosus atrophicans' rather than white spot disease. (Weissflecken Krankheit)

THE NOCIFENSOR SYSTEM OF NERVES AND ITS REACTIONS*

BY

SIR THOMAS LEWIS, M.D., F.R.C.P., F.R.S.
Physician to University College Hospital, London

LECTURE II

The three reactions described in the first lecture were all discovered by observations carried out exclusively upon human subjects. The fourth, to which I now come, was first described in animals, and has been submitted to close experimental investigation in these.

4 The "Antidromic" Flush

The first definite statement of vasodilator nerves in the posterior roots was made by Stricker in 1876. But his observations remained unaccepted until Bayliss's careful experiments were recorded in 1901. Bayliss (1900–2) found that stimulation of the distal ends of the cut posterior roots by current, or mechanically, produces a long-lasting vasodilatation of the limb supplied. He showed that the cell stations of the fibres conducting the impulses to the vessels lie in the posterior root ganglia, for the effect remains after the posterior roots are cut but is lost after the ganglia are excised. He concluded that the fibres concerned are the ordinary sensory afferent fibres of the posterior roots and that vasodilatation of the limb is effected by 'antidromic' conduction as he called it at Langley's suggestion. Similar vasodilatation can be produced by stimulating the distal ends of nerves to the limbs or cutaneous nerves and these reactions have been studied by Langley (1923–4) and by myself and others (Lewis and Marvin, 1927), mainly in the cat's paw. Foerster has shown in recent years that reddening of the human skin over appropriate segments occurs when the posterior roots or nerves of the limb running to the skin have been cut and are stimulated distally. In the case of the cat stimulation of a small nerve of the paw flushes the bare surfaces of those pads which the particular nerve supplies, and flushes them sharply to a boundary. Langley first observed this, and, adopting my method of identifying active capillary dilatation, found that the flushing is produced even during circulatory arrest. He therefore, and rightly, concluded that the flush is due to capillary rather than to arteriolar dilatation in this animal.

The conception that the vasodilatation is due to antidromic conduction in sensory nerve fibres was grounded upon the contemporary belief that all posterior root fibres are afferent. Several workers (Ranson, Kure, Tower) have since described intact fibres in the spinal ends of the cut posterior roots many days after section. These have been much discussed, and have generally been regarded as regenerated from the root ganglion. But Kahr and Sheehan (1933) traced intact fibres in this root after removing the ganglia, and Barron and Matthews (1934–5) have recently supplied some remarkable evidence both physiological and anatomical, that fibres having their cell stations in the posterior root ganglia pass into the cord and send collaterals out again through neighbouring posterior roots on their way to the periphery. It seems from the observations of Matthews that these fibres normally carry impulses out to the periphery, but if that is so then it is difficult to regard the system of nerves in question as subserving a sensory function. Thus the evidence from this source inclines us to recognize that there are fibres other than sensory in the posterior

HILAR CHANGES IN "EARLY" TUBERCULOSIS

Rontgenatlas Fruhtuberkuloser Veranderungen im Hilus By Dr R Czarnecki (Pp 98 308 figures RM 24) Leipzig G Thieme 1936

In current practice lateral skiagrams of the chest are as a rule only taken in occasional cases in order to localize tumours of the mediastinum and oesophagus or foreign bodies and to determine alterations in the shape of the heart and vessels Czarnecki of Leipzig has produced an atlas that should do much towards showing the possibilities of this radiological technique in connexion with tuberculosis and particularly in elucidating the problem of the development of the early ' lung lesion in the adult The book is mainly concerned with Ranke's first and second stages of tuberculosis and the author maintains that his work which has embraced the systematic examination of the hila by lateral radiography of every patient under his care since 1926 lends good support to Ranke's conception of the disease

Dr Czarnecki has used throughout a standard technique which he describes and the volume comprises beautifully reproduced skiagrams, some of which represent serial photographs of the same patients over a period of several years The clinician will be specially interested in the hilar changes (many of which are detected only by lateral radiography) associated with obscure mild constitutional symptoms, which are explained by the generalization in Ranke's second stage It must be admitted however that a good deal of experience will probably have to be acquired by the reader before he is able to interpret the finer shadows in the lateral skiagrams with the surety of Dr Czarnecki who himself insists that the whole clinical picture and laboratory aids must be taken into account in arriving at a diagnosis

Notes on Books

In his *Prelude to Chemistry* (G Bell and Sons 12s 6d) Dr JOHN READ, F R S, has conceived the idea of carrying the reader back to the environment of the experimenters of the Middle Ages and beyond and of capturing the spirit in which things were then viewed In the aspect thus presented alchemy was esteemed to be one of the humanities and the experimental researches of those days were prompted by a genuine desire for a knowledge of the truth, and not as is sometimes thought the outcome of a morbid desire for the discovery of treasure or the means of practising imposture Adopting this outlook Read has shown how the old philosophers held their chemistry in much the same esteem as other branches of learning and the cultivated arts The author has made extensive historical researches, which include a number of new observations and has produced a very useful and readable history Its value is greatly enhanced by the inclusion of upwards of a hundred excellent illustrations copied from ancient prints

The transactions of the seventh Scandinavian Medical Congress which was held at Copenhagen from June 27 to 29, 1935 have recently been published in the form of a large supplement to *Acta Medica Scandinavica* Of 101 papers contained in the volume sixty seven are in English twenty four in German and ten in French The principal subjects discussed are functional tests of the heart electrocardiography, various aspects of haematology diabetes mellitus, gastro intestinal diseases and respiratory affections including a paper by Jacobaeus on the surgical treatment of intrathoracic tumours The volume is published at Copenhagen by the Imprimerie Royale Bagge

The third volume of the forty sixth series of *International Clinics* (Lippincott 4 vols quarterly 50s) consists of four unequal parts devoted respectively to surgery medicine, a neurological and pathological conference on a case of carcinoma of the nasopharynx and recent progress in ophthalmology and oto rhino laryngology The surgical section contains four papers dealing respectively with malignant melanoma pilonidal sinus (congenital cyst and sinus in the sacro coccygeal region), and lithopaedion, of which about 177 cases have been recorded between 1582 and 1926 Of the ten papers in the medical section attention may be drawn to those on the differential diagnosis between Hodgkin's disease lymphosarcoma and aleukaemic lymphadenosis the diagnosis and treatment of disorders of micturition in diseases of the nervous system undulant fever, spontaneous hypoglycaemia and the nature and treatment of non organic chronic fatigue in the child A paper on experimental and clinical studies on staphylococcus toxin and antitoxin represents the contribution to ophthalmology and another on suppuration of the petrous pyramid deals with the symptoms and diagnosis of this condition

Preparations and Appliances

A POLARIZING OPHTHALMOSCOPE

Mr J D M CARDELL F R C S, writes

Nearly everyone has experienced the annoyance caused by the corneal reflection of the ophthalmoscope lamp obscuring a part of the fundus which one particularly wants to see This is still more the case when the pupil is small either by reason of past iritis or from the use of eserine in a case of glaucoma Nor is it advisable in the case of many elderly patients to dilate a pupil which is naturally small These considerations and the demonstration by Mr Rugg Gunn in 1926 of his polarizing retinoscope used in the refraction of cases with scarred corneae resulted in the evolution of a polarizing ophthalmoscope and the satisfactory removal of the annoyance *In this I was greatly assisted by the advice* of Mr Keeler

After the instrument had been completed and described at the annual congress of the Ophthalmological Society of the United Kingdom in 1935 I learned that an instrument had been made in 1920 to achieve the same purpose I believe there are not more than one or two such instruments in the country It is a somewhat large piece of apparatus unsuitable for everyday use by means of which the fundus can be viewed by the indirect method It lacks the mobility of the instrument to be described which is used in the same way as an ordinary self luminous ophthalmoscope and which gives a direct non inverted view of the fundus with the usual magnification obtained by that method

Polarized light was discovered in 1669 by Bartholinus who investigated the optical properties of doubly refracting Iceland spar or calcite This crystal shows its power of double refraction when placed over a dot marked on a sheet of paper When viewed from a position vertically over the position of the dot two dots are seen instead of one one corresponds with the position of the dot on the paper and the other is displaced to an amount proportional to the thickness of the crystal (Fig 1) On rotating the crystal still keeping it in contact with the paper the first dot remains stationary and the displaced image rotates round it

This phenomenon was further elucidated in 1690 by Huygens who showed that light passing through calcite was divided into two distinct rays of equal intensity One passed through without refraction and was called the ordinary ray the other the extraordinary ray was deflected but emerged parallel with the first In 1810 Malus found similar peculiarities in the light reflected at particular angles from glass or water The locus of a particle of light is perhaps best illustrated by the figure produced by pulling apart the ends of a wire which has been bent into gentle curves in all

root system, and in this respect it is harmonious with what has been concluded in earlier parts of these lectures Although the posterior root's constitution is being closely re-examined by physiologists, and especially in relation to what has hitherto been called "antidromic" conduction, we do not yet know quite certainly that vasodilatation is ever provoked naturally through posterior root channels, neither are the fibres that give this response to artificial stimulation positively identified

The idea that the vascular dilatation under discussion results from the release of an appropriate substance peripherally was first put forward on a definite basis by Marvin and myself in 1927 Langley apparently first suggested to Bayliss that such a substance may be released, but as there was then no tangible evidence for such release Bayliss considered it unfavourably Langley recorded his idea later (1923), though I have been unable to ascertain what prompted him, unless it was his conclusion that the effect is capillary rather than arteriolar The idea came to Marvin and myself independently when we noticed the long delay in the appearance and disappearance of the vascular reaction in response to short stimulation in cats, for these time relations reminded us of those of the flare in response to local injury We sought for a means of testing the matter crucially and found it in arrest of the circulation, which by holding the released substance in place prolongs the reaction by just that period of time over which the blood flow is arrested This experiment not only gave us evidence of a released substance but showed this substance to be relatively stable We regarded the substance responsible for flushing of the pads of the cat's foot as a histamine-like substance acting upon the minute vessels of the skin A few years later Kibjakow (1931) reported vasodilator substance in blood returning from a paw during distal stimulation of the posterior roots, but his evidence was unconvincing More recently Ungar and his associates (1935) have found similar stimulation to result in increased secretion of hydrochloric acid in the stomach, a well-known effect of introducing histamine into the circulation To these observations, which indicate histamine release, Wybauw (1936) has quite recently added others strongly supporting the view, first inferred by Dale and Gaddum in 1930, that there is a release of another natural vasodilator substance—namely, acetylcholine Thus it becomes possible, if not probable, that there is a twofold release H substance playing upon and directly dilating the capillaries, and acetylcholine acting upon and dilating the arterioles

I emphasize these peculiar effector reactions because they tend in themselves to separate the nerves concerned from the sensory system and to place them in the category of those of the nocifensor system, which are known or are suspected to produce their effects through the intermediary of cutaneous cell products

General Hypothesis of "Nocifensor" Nerve Effects

In earlier parts of these lectures I have described, first, how hyperalgesia spreads around a local injury, and secondly how similar hyperalgesia appears in the territory of a cutaneous nerve stimulated distally Thirdly I have redescribed the chief phenomena of the flare produced around a local injury and fourthly the vasodilatation following distal stimulation of posterior nerve roots or cutaneous nerves

When we view all these four together they appear linked for each reaction of hyperalgesia seems to have its vascular counterpart The two reactions of hyperalgesia clearly employ an identical effector mechanism the third employs the same or a closely related mechanism All these three employ nerves of the posterior root system, but not sensory constituents, the fourth also concerns nerves of the posterior root, but nerves which we have to regard as probably not sensory The term "nocifensor" was first applied to the first two reactions I widen it to include the third reaction, the "flare" This widening of definition means perhaps that we must recognize fibres of separate function within one special system The inclusion of the fourth reaction, despite seeming close linkage, should, I think, still wait on time and further observations It is the least solidly established within the nocifensor group Difficult as it may be to believe that it is not of the same category, some evidence remains which makes its inclusion uncertain When both posterior root vasodilatation and "flare" were thought to depend on sensory nerves, one system for the two reactions was a natural conception, but the identity of the nerves underlying these two reactions has not been proved

Vasodilatation from nerve trunk stimulation in the cat's paw is largely a minute vessel effect, and this is associated with release of a stable vasodilator (histamine-like) substance No evidence has been found that the capillaries play an active part in the flare phenomenon, though it has been sought closely and repeatedly And, consistently, none has been found that stable vasodilator substances are released in the flushed skin, on the other hand, the evidence is opposed to such release* It may be that this difference in the type of vascular reaction has been found because the reactions have been studied in cat and man respectively, and are not strictly comparable On the other hand, the difference may be fundamental A second seeming disagreement is found between the characteristics of the nerves, for whereas I find the flare reaction abolished in relatively early stages of asphyxia, and at a time when slow-conducting nerves of the skin are still functioning Hinsey and Gasser (1930) associated the vasodilatation of posterior root stimulation particularly with the slow-conducting fibres

5 Reaction to Cold

There is a vascular reaction, certainly related to those already described and one of obvious importance in defence I discovered this reaction while investigating the sensation of warmth that develops in the fingers when they recover from handling snow (Lewis, 1930) If a single finger is immersed in ice-cold water, kept there for five or ten minutes, and then withdrawn, this finger warms up very rapidly and becomes even hotter than its fellows Investigation shows that the vasodilatation happens while the finger is actually exposed to cold The finger in the cold bath is at first painful, but after a time the pain and even the sense of coldness, vanishes A thermal junction strapped to the end of the finger shows at this time that the temperature has ceased to fall and is beginning to rise So great is the fully developed vasodilatation that the thermal junction may show a rise of 5° or 10° C (9° or 18° F) above its low point of cooling while the finger still remains immersed in ice-cold water The reaction lasts ten to thirty minutes and subsides the finger cools again and the events are repeated The immersed finger is kept at a temperature in the area well above freezing-point To display the reaction it is unnecessary to cool to this degree, immersion at 5° C 10° C (41° or 50° F) provides quite obvious reaction and there is a distinguishable response when cooling is no lower than 15° C (59° F) or even 18° C (64° F)

* It is to be stated that the evidence referred to (Lewis, Grant and Marvin 1927) does not exclude the release of an unstable substance such as acetylcholine but here this is not the relevant point

directions Thus, although the path is not a spiral one, it can be resolved into two linear components at right angles to each other, and proceeding in the line of propagation of the light

Light may be polarized in a plane, circular, or elliptical manner It is with plane polarized light that we are concerned here As already indicated, plane-polarized light is obtained when light is passed through Iceland spar, the rays being divided into "ordinary" and "extraordinary" For practical use the ordinary ray must be eliminated This is done by a Nicol prism, which stops the passage of the ordinary ray by total reflection within itself This prism is made by working the calcite in a special relation to its optical axis,

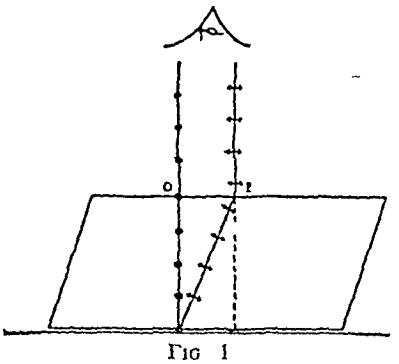

FIG 1

cutting the piece so obtained obliquely in two, and cementing the two halves with Canada balsam, which has an index of refraction lying between the indices of the calcite for the ordinary and extraordinary rays The ordinary ray reaching the balsam at an angle greater than the critical angle, is totally reflected by it and absorbed by the black coating on the outside of the Nicol prism The extraordinary ray suffers no such reflection, and therefore emerges from the prism as a beam of plane polarized light (Fig 2)

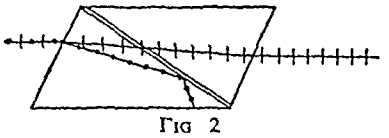

FIG 2

The direction of polarization, or vibration, of the beam is parallel to the short diagonal of the prism—that is, perpendicular to the balsam film Viewed by the naked eye the light emerging from the prism does not differ appreciably from ordinary light, except that there is a reduction in intensity If however, a second Nicol prism is placed in front of the observer's eye and rotated the beam from the first prism will become fainter and finally disappear This happens when the short diagonal of the second prism is at right angles to the plane of polarization The second prism may thus be made to transmit or stop the extraordinary ray from the first prism (Fig 3)

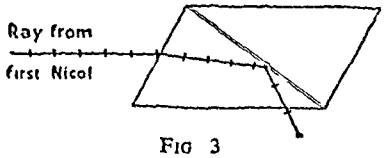

FIG 3

Description of Ophthalmoscope

In the ophthalmoscope made for me, after a great many experiments by Mr Keeler these principles are employed Rays of light from a powerful source in the handle are rendered convergent by a condensing system They then traverse a Nicol prism and come to an approximate focus on a battery of thin glass plates in contact with each other The plates are set at an angle of 45 degrees to the long axis of the instrument A second Nicol prism in the eye piece can be rotated around the line of sight of the observer and be fixed in any position The adjustment of this prism is made by the optician Plane polarized light from the first prism is reflected unchanged by the glass plates in the direction of the pupil Some of the light is reflected by the cornea, still plane polarized

The light passing into the interior of the eye is reflected by the fundus, and emerges from the eye again as depolarized light Thus the reflection from the cornea differs from that from the fundus in that the former is plane polarized By rotating the Nicol prism in the eye piece into the appropriate position the reflection from the cornea is totally eliminated Of the light reflected from the fundus only part is eliminated by the prism in the eye piece, the fundus being seen by the remainder The details of the fundus are, of course, unchanged morphologically, but the appearance differs slightly from that obtained by an ordinary ophthalmoscope in that the glare from the internal limiting membrane and from the vessels is reduced This is a decided advantage

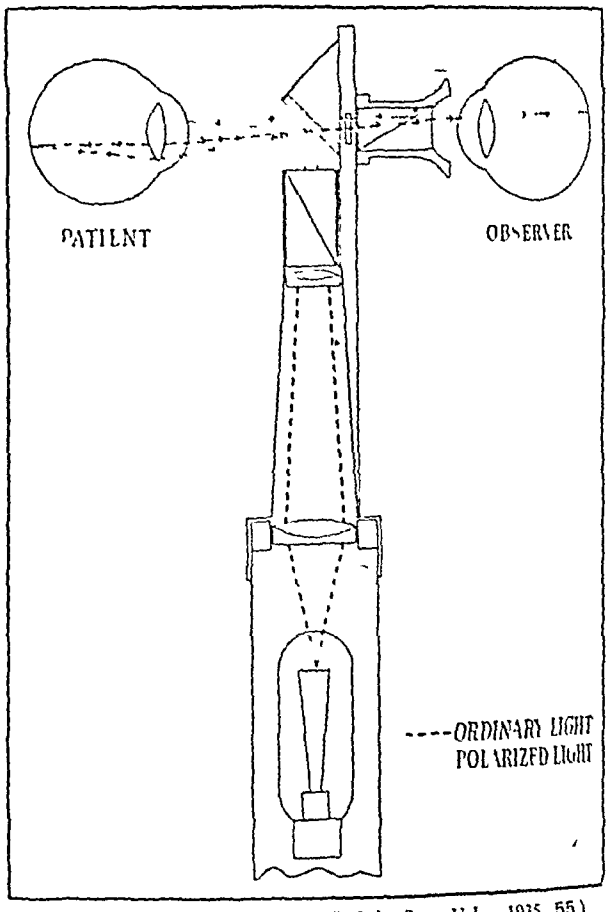

FIG 4 (Taken from *Trans Ophth Soc U K* 1935, 55)

The improvement over ordinary ophthalmoscopes self luminous and non luminous, is obvious It is possible to obtain a view of the macula through a pupil contracted by eserine with the high magnification of the direct method It has been found that the fundus picture is less obstructed by corneal and lenticular opacities than when using other methods A truer estimate can be formed of what a patient with such opacities may be expected to see The glare from the vascular coats being reduced, a diagnosis of hardening of the arteries is made less frequently and in my view correctly so The view of the macular region which can be obtained is excellent, and is only curtailed by the movements of the patient's eye An attachment in the head of the ophthalmoscope allows the use of red free polarized light and the beam to be dimmed in intensity or to be narrowed to the size of the pupil to avoid glare from the iris

The instrument will prove invaluable in teaching students who are beginning their study of ophthalmology Whereas it used to take a certain amount of time and patience to get them to see small details they can now, assuming average intelligence, appreciate a fundus picture at their first attempt.

These reactions are not confined to experiments arranged within doors, they occur naturally in cold weather out of doors In walking out of doors in cold air or in working with hands in cold water, it is usual for the temperature of unprotected hands to fall almost to that of their surroundings But they do not remain cold in healthy people when they have cooled to a certain point which may be reached in a half hour or more they react and become warm again It is clear from the range of provocative temperature that the reaction must come into very frequent play during the colder months of the year in northern climates The importance of this reaction as a protective mechanism against prolonged overcooling is emphasized by considering the remaining responses to cold When the surface of the body is cooled general vasomotor tone increases, at the same time the digital arteries respond directly to the cold by contracting this contraction by lessening blood supply, exposes the finger to further loss of heat and to further constriction of its vessels Thus these two factors acting alone would inevitably bring about advanced and stable arterial spasm, such spasm is avoided or is relieved by the intervention of the reaction here described

The reaction is found in the fingers and toes the palms and soles, the lobe of the ear the nose and the chin It seems to be especially well provided for just where it is wanted—namely in parts of the body that project have large surfaces and are easily cooled It is most conspicuous in the digits, which cool more than any other part and these are richly provided with arterio venous anastomoses which vigorously participate in the response (Grant and Bland 1929–31) I have recorded the reaction in the cat's paw, and Grant has studied it in the feet of birds and ears of rabbits

The underlying mechanism is nervous The reaction occurs in man after section of the mixed nerve to the skin up till the time of its degeneration but not after wards and it is present after sympathetic degeneration Thus the reaction happens as a local axon reflex in nerves belonging to the posterior root system like those pre viously described This conclusion, which I arrived at from my original observations upon human fingers has been confirmed recently by Wybauw for the cat's paw (1936) the reaction is maintained after posterior root section, but is lost when after ganglionectomy the nerves degenerate From my earliest interest in this subject more than seven years ago I took the view that the mechanism constitutes an important contributory means by which the temperature of exposed parts is normally maintained and the skin guarded against seriously injurious cooling, and that the fall of temperature of fingers deprived of their mixed nerve supply as in injuries of peripheral nerves, is due to the loss of this local reflex This view has been corroborated by later observations, many of which have been published with Dr Pickering (Lewis and Pickering 1936) and quite recently by Wybauw who finds that the cat's foot deprived of nerves of the posterior root system by ganglionectomy (ensuring degeneration) becomes habitually lower in temperature than the foot to which the roots have been cut proximally to the ganglia

In my earliest account of it I took the view that the reaction described is comparable to the flare and regarded the stimulus to the reaction as the same as that arising in acute injuries of the skin—namely the release of H substance But there have been minor objec tions to the view that the reaction is equivalent to that occurring in the triple response (Grant Bland and Camp 1931–3) There is no doubt in my mind that the stimulus cold injures the skin and releases a substance, but this substance is not necessarily the histamine like substance which underlies the flare There is also no doubt that in ice cooling the nocifensor nerves are stimulated The finger which has been immersed and reacts becomes hyper algesic and this hyperalgesia spreads in susceptible sub jects and when the finger is the fifth to the whole cutaneous area of the ulnar nerve A vascular reaction has never been detected however beyond the limits of the finger cooled The proved nocifensor element in the reaction is hyperalgesia the associated vascular reaction may be comparable to that of the flare, or it may be more akin to that which has been termed antidromic assuming the two last to be really separate Thus it will be gathered that the vascular reaction to cold like those previously described, is probably to be reckoned among nocifensor reactions, though its precise relation to the remainder has not yet been determined

It is tempting to bring all the five reactions described unhesitatingly together and definitely to ascribe them all to the same system of nerves such an idea has indeed very much to support it but the conclusion cannot be drawn in the present state of our knowledge with the finality that we might desire

Trophic Nerves

It is desirable to refer briefly in these lectures to the old hypothesis of trophic nerves

The term "trophic change was introduced to imply a change of nutrition Early in the nineteenth century emphasis was laid upon the control of nutrition by the nervous system and upon the possibility of lesions arising out of disease of the brain or spinal cord Thus in 1831 Mitchell was attributing acute joint trouble to irritation of the spinal cord By the time Charcot (1872–3) gave his well known lecture on disorders of nutrition and largely as a result of his work, the idea had taken fast hold as he said there is nothing better established in pathology than the existence of trophic troubles con secutive to lesions of the nervous centres or of the nerves The truth of this statement is no less obvious to day than in 1872 when it was written When a motor nerve is cut the muscle atrophies, when the nerve to a secreting gland is cut the gland changes Disuse, acting directly and diminished blood supply, whether primarily the result of a nerve lesion or as so often happens itself the result of disuse, are two common and well recognized channels through which nervous diseases cause trophic change using the term in its literal sense of nutritional change Relevant examples are many but they are diverse It we allow the word trophic a wider meaning and include inflammation then we may cite as further examples of neurotrophic lesions such ulcerations of eye or foot as can be attributed partly or wholly to insensitiveness of the corresponding structures and to injury arising therefrom Sherrington (1900) aptly said that every nerve and nerve centre that can influence the proper and specific activity of a tissue—and that is the sole function of nerves—possesses in so far, a trophic influence on that tissue If by trophic nerve be understood no more than this all nerves are trophic nerves

But more than this has often been inferred or implicitly stated A notable instance was that of Claude Bernard (1852) who at first misinterpreted the function of the cervical sympathetic regarding it as controlling meta bolism, but abandoned the view when Brown Séquard and he recognized its vasomotor function The hypo thesis of special trophic nerves' came from Samuel in 1860 He believed in nerves *sui generis* directly in fluencing nutrition growth and new cell formation and

PSYCHOLOGY IN INDUSTRY*

BY

MAY SMITH, M A , D Sc

Investigator to the Industrial Health Research Board

Until the present century psychology had no place in industry, for to industrialists and economists alike it was only an academic discipline not even remotely connected with life On the other hand, since psychologists had no direct experience of industrial conditions they ignored industrial problems Occasionally a research worker thought that his research might have an industrial application, but there was no organic relationship between the industrial problems and psychological research †

The industrial doctor is however not quite a "modern As far back as the second century we read that Galen, before his appointment to the post of doctor to the Emperor Marcus Aurelius, was medical officer to the Roman school of gladiators—apparently they mattered Armies in most ages have had their doctors

The first recognition to my knowledge of industrial occupations studied seriously was when Ramazzini in the seventeenth century published a book on the Diseases of *Tradesmen He was a professor of medicine at Modena,* where it was the custom to clear out the cesspools every three years, and he was so struck with the miserable appearance of the workmen doing this that he got into conversation with them about their work , that led him to an interest in other occupations, the diseases peculiar to each and the possible methods of treatment He included in his list the diseases of learned men hoping that men of letters will not take it amiss to find themselves ranked in the class of tradesmen, considering that as they purchase to themselves by the pursuit of letters, if not great estates like those of the merchants at least a livelihood and many comfortable conveniences Secretaries to great men become melancholic owing to the strain of correcting their master s work and living in the uncertainty of how it would be received Nearly two hundred years were to elapse before any further investigations were to take place Ramazzini s book remained the standard textbook for over a century

"The Human Machine"

Industrial development during the nineteenth century was governed by the claims of machinery rather than of man The enormous development of machinery during the century, the studies made in the natural sciences, and the growing knowledge of the mechanism of the body all tended to focus interest on man s likeness to a machine. The phrase 'the human machine which rightly interpreted refers to part of his structure became rather by implication than design synonymous with man himself In so far as any attempt was made to study the worker of the machine the tendency was in the direction of showing the likeness of one worker to another and the likeness of all to machines

The problem of munition work during the great war challenged the adequacy of this point of view Industrial operations as conducted at the beginning of that period were implicitly based on an unjustified application of arithmetic If 6 units of work could be done in one hour then 6×3 would be done in three hours and 6×12 in twelve hours The physiological necessity for *sleep prevented the indefinite extension of the principle* The discrepancy between the expected and the observed facts led to inquiry and although it was not recognized then, that stage marked an epoch in the history both of psychology and of industry The focus of interest changed from the machine to the worker of the machine The failure of the twelve hour day to produce twelve times as much output as one hour, and the high sickness absence led to the formation in 1916 of the Health of Munition Workers Committee and after the war, under the title of the Industrial Fatigue Research Board a small department was formed to carry on investigations into the human aspects of industrial work The problem of fatigue which had exercised a curious fascination over psychologists for years proved to be the connecting link between the older and the newer study although in spite of the voluminous literature on the subject and the innumerable experiments there proved to be little of practical applicability The earliest investigations were concerned with the relation of the worker to the material environment—length of the working day the duration of rest pauses the effect of lighting heating and ventilation

These investigations, although concentrating on the worker did so relatively objectively and enabled us to get some insight into the conditions that affect numbers in a group Certain problems, however proved to have little or no relation to environmental or physiological conditions the known effects of which were in some cases masked by factors relating to the mental environment and to particular characteristics of the individual worker—for example, the effect of the temperamental make up of the people in authority and of individual workers incentives , the suitability of the worker for his work the effect of age and outlook monotony , liability to sickness and accidents Again the focus of interest has been shifted, and there are indications that the problems of the immediate future lie rather with studies of individuals than with groups as such, and with the mental no less than with the physical and physiological aspects This general change is well illustrated by the history of two particular problems *(a)* industrial accidents, and *(b)* telegraphists cramp

Industrial Accidents

As is well known the introduction of machinery on a large scale into industry had as a serious consequence numerous accidents—fatal, disabling and slight Efforts have been made for many years by the Home Office to reduce these by guarding machinery, but it is recognized *that 'however well machinery is guarded we cannot look* for more than a 10 per cent reduction in the accident rate by the provision of safeguards alone

Any person who considers accidents in ordinary life is likely to realize that some of the so called accidents are not quite as accidental as they would appear He will observe that having had one accident some people are liable to be so nervous that they have more a view embodied in the popular belief that one accident involves the victim in three On the other hand one accident does make some people more careful He will also have observed that there are people generally called clumsy who seem to attract accidents When two statisticians Professor Greenwood and Mr Udny Yule had the curiosity to test these rival views by studying the actual accidents that occurred in large groups of people over a considerable period of time history was made They worked out what an accident curve would look like assuming the truth in turn of each of the above views and although in a particular case any one hypothesis might represent the conditions yet the one that most *nearly conformed to the facts* for the group was the last one—namely that there are people who have some idiosyncrasy predisposing to a relatively high accident rate

We are then faced with two problems What is this idiosyncrasy? Can we by some test or tests discover the accident prone at an early stage? Mr Farmer and Mr Chambers have been working on the second problem for years and they can by tests select from a group those most liable to have accidents but so far the tests would eliminate too many

* Part of a paper read before the Industrial Medical Officers Association at the London School of Hygiene and Tropical Medicine January 22 1937

† In studying the effects of loss of sleep I found that among these effects were uncontrolled motor adjustments exhibited some time after the conscious effects of fatigue had passed away the corollary was drawn that perhaps serious accidents in such work as railway signalling might be similarly motivated This corollary may be true but the only way to know the facts is to examine railway signalmen

capable also of provoking inflammation He ascribed separate effects to their paralysis and to their stimulation, and brought an array of experimental and clinical evidence into support of his views His experiments though numerous were crude, and possess little value to-day On the clinical side he cited many previous reports, and followed Brown-Sequard's view (1859) that herpetic eruptions after nerve injuries are irritative and Baerunsprung's attribution of zoster to affection of the spinal ganglia Tangible evidence for the existence of a distinct system of nerves having the functions he ascribed to them is not to be discovered in his book, and his hypothesis rightly won little credence, there has been no reason to believe that nerves influence the nutrition or growth of tissue directly, but only indirectly by altering blood flow or by controlling the tissue's specific function But although Samuel's hypothesis failed he was right in stressing as unexplained the apparent effects of nerve irritation The mystery of the cases that have come to be called "causalgia" has remained, when Brown-Séquard concluded such lesions to be the result of irritation he may have been correct, but this fails to satisfy Samuel's suggestion that they result from the excessive action of his special nerves of nutrition an overaction exploding in inflammation, was not grounded on proper evidence, but it contained an element of truth For according to our present evidence distal stimulation of cutaneous nerves does provoke some of the phenomena of inflammation—namely hyperalgesia and reddening—and may conceivably provoke more And it is of further interest to remark that while we cannot follow Samuel in regarding the nerves involved as special nerves of nutrition, we are coming to regard them as nerves exercising a special function, termed for convenience "nocifensor"

Conclusion

We have concluded that a specific system of nerves, connecting to at least the skin, exists This system of nerves is capable of effecting changes in the skin locally and without reference to the central nervous system, though very possibly also capable of excitation from brain or cord In speculating about the mode of action of these nocifensor nerves with a view to presenting a fuller if more hypothetical conception of them we might venture to suppose that they are nerves exercising no direct influence upon the nutrition of the skin but comprising in their actions an influence more akin to a process of secretion—and in parenthesis it is interesting to note that Charcot inclined to interpret Samuel's ideas in a similar sense We might regard the nerves as liberating potent substances from cellular elements of the skin into surrounding spaces, and thus controlling partly or wholly within the skin important elements of defence, including inflammation

ACTIVE IMMUNIZATION AGAINST TETANUS

BY

HERBERT H. BROWN, O.B.E., M.D., F.R.C.S

Passive immunization against tetanus was used with considerable success during the great war In October, 191 there were thirty-two cases of tetanus per 1,000 of the wounded admitted to the hospitals in England, but in November, after the general adoption of passive immunization of the wounded, the incidence fell to 1·7 per 1,000, and among those cases which did occur the mortality was lower

Objections to Passive Immunization

Passive immunization, however, has serious disadvantages Antitoxin, to produce the best effect, should be injected within twenty-four hours of sustaining the injury this, for several reasons, may in many cases be impracticable Another disadvantage is that antitoxin from the introduction of a foreign serum quickly begins to disappear from the circulation, and within a fortnight is no longer in sufficient concentration to afford protection, the injection has to be repeated at weekly intervals and before any subsequent operation is undertaken, since tetanus bacilli or spores may remain latent in the tissues for long time

Another serious drawback is the sensitization to horse serum, which to a greater or less degree follows immunization with antitoxin derived from immunized horse a sensitization continuing for many years Troublesome serum reactions, and even severe and in some cases fatal anaphylactic shock, may accompany or follow the subsequent injection of a therapeutic serum which may be urgently required in the treatment of an infection such as diphtheria

Sensitization also considerably diminishes the immunizing effect of a further injection of serum Glenny and Hopkins (1922) found that while in the case of a normal rabbit the titre of antitoxin in the blood dropped to a low level in twelve days after the intravenous injection of antitoxic horse serum, in the case of a rabbit sensitized to horse serum the same low level was reached in four days Kahn and McDermott (1934) found that while the injection of 5 units of diphtheria antitoxin could protect a normal rabbit against fifty minimum lethal doses of diphtheria toxin, 75 units were required when the animal was sensitized to horse serum

Tetanus Toxoid

Active immunization by tetanus toxoid has none of these disadvantages There is no more difficulty in immunizing against tetanus than against diphtheria, it is quite free from danger and the result is just as satisfactory Complete and permanent immunity is obtainable A commission to study the question of prophylaxis against tetanus in the French Army strongly re-

Telegraphist's Cramp

Telegraphists who have been trained to "send" telegrams by the Morse or Baudot systems are liable to a disability that prevents them from sending effectively This disability may be of such a nature as to interfere with most muscular activities, or it may be limited to the sending of one particular sequence of dots and dashes The most usual explanations were that the constant delicate movements made in "keying" had resulted in chronic muscular fatigue, the cure for which would have been rest, or that some organic disease of the nerves and muscles of the arms had been set up Neither explanation proved to fit the facts, and a detailed study of the general environmental conditions failed to find any one that was the invariable antecedent of cramp

Attention was next turned to an experimental study of the cramp group and a group of others not so affected, with regard to neuro muscular ability On *a priori* grounds one would expect that telegraphists suffering from cramp would be less efficient than the others at all tests involving speed and accuracy of hand movements The tests, however, failed to differentiate the two groups adequately, some of those with cramp being quite as efficient as those without The next stage of the investigation was to find out the differences, if any, in temperamental make up The results showed that over 75 per cent of the cramp group had symptoms that would lead, quite apart from the cramp, to the diagnosis of an emotional disturbance known as psychoneurotic, or in more popular language, 'nervous", in the other group only 35 per cent had such symptoms Thus two investigations, conducted along different lines by different people, have certain unforeseen stages in common, leading from a study of the external and general conditions to the personal and particular This latter investigation, involving as it did a study of nervousness opened the way to the possibility of extending the method to other problems, of which some are

1 What is the incidence of nervous symptoms in different groups?

2 Why in some groups does sickness absence from the so called nervous disorders increase even in the presence of excellent material conditions?

3 In what conditions will the nervous person break down?

4 Why are some workers erratic, oscillating in output between extremes?

5 What is the effect of nervousness in people in authority and in subordinates?

6 What part is played by nervousness in industrial success and failure?

7 What are the factors environmental and other, that protect the nervous person or determine breakdown?

Some of these have been attacked during recent years, some have been surveyed, and others cannot be attempted yet

Vocational Guidance

Observation of individual workers shows that in particular posts some are more successful than others, whether we take an objective standard of efficiency—where such exists—or the subjective one of personal happiness Hence there has arisen the study known as vocational guidance, sometimes erroneously supposed to be the same as vocational selection" The former sets out to select for a given person the work most suited to his capacities Theoretically this presupposes a complete knowledge of the individual concerned, a knowledge of all possible occupations and their requirements, and an ability to relate the one to the other In practice we never approximate to this ideal

In vocational selection we assume that the physical and mental requirements for the work are known we then select by appropriate tests from a number of applicants those most nearly coming up to the requirements Many firms have developed a series of tests used by them in the selection of workers For a large number of occupations, however, the requirements are not known What, for example, apart from the technical ones are the qualities that make for success as a doctor? It may be that there is some one outstanding quality which some day we may be able to isolate and test, it may be that success in the same environment may be achieved by people with very different qualities

It is true to say that we can now, within a very narrow margin of error, test the intelligence of a child and express it in quantitative form It is also known that certain occupations require a high degree of intelligence, whereas others do not It is as futile to put a child of high intelligence to work needing little as to put a child of inferior intelligence to work needing a high degree The one is wasteful, the other provokes unhappiness

This problem like so many others, is not of modern formulation, although it is one of modern application At the beginning of the sixteenth century an English version of a Spanish book, *Examen de Ingenios*, by Huartes was made under the title *The Examination of Men's Wits* In it was made a plea for the recognition of differences of "wits or, in modern language, intelligence and it was suggested that in a well-ordered commonwealth men of great wisdom and knowledge should be appointed to discover each one's natural sharpness so that he might be set to learn what was most appropriate to it Huartes also analysed the various professions from the point of view of the mental qualities required in them He was much concerned that physicians of great learning often proved to be very bad practitioners, and he decided that theoretical medicine demands memory and understanding but its practice imagination Perhaps he was right

Extravagant claims are put forward by some exponents of tests, claims which a critical scrutiny shows cannot be always substantiated, but this is not to say that they are useless The alternatives are examination successes or a personal interview, neither of which is wholly satisfactory Some people claim to be able to select the right person for a particular post by intuition this seems to be all right so long as no one challenges the results The use of tests is to give us more data on which to base a judgement, not to act as a measure to relieve us of the necessity for judgement Ultimately in industrial selection as in the diagnosis of disease the diagnosis is an art

Differences in Temperament

Suppose, though that we do know the requirements for a particular activity—typing for example—and that we have designed tests that are statistically sound and practicable to use, we have still only considered part of the problem The actual movements or intellectual equipment that are necessary are only part of the whole The activity has to be performed in particular circumstances and by an individual who has other characteristics in addition to those needed for typing These circumstances and these characteristics are often of equal importance and sometimes of more importance Let us assume that we have two typists equally efficient at typing dexterity and equally intelligent Can we predict equal success in a given organization? One of them may be moody, resentful of criticism, irrationally antagonistic to any command, uncertain of herself liable to worry at night over possible and even improbable mistakes the other may be bright reasonably careful but able to dismiss from her mind work that can no longer be altered easily with others, whether equals or superiors It does not demand much knowledge to say that while the actual typing on a given occasion may be for practical purposes identical, yet the total result over a number of years will not be The worrying over mistakes in all probability not made, is likely to lead to real mistakes and the chances of the first typist breaking down are more probable than those of the second Nor will a bottle of tonic or an injunction not to worry be adequate to the situation

sequent demand for an increased production of thyroxine and for an increased supply of iodine to meet this increased production How far these observations in animals have a bearing on the problem of endemic goitre in man is still unknown

The view expressed by Repin in 1908 that radioactivity in soils and waters of regions where endemic goitre prevails is a goitrogenic factor has lately been revived though goitre is said to prevail in certain localities where no such radio activity exists But that is no reason why it should not exert a goitrogenic action in regions where it does exist A re examination of the question appears to be called for

INSANITARY CONDITIONS

Insanitary conditions involving the contamination of the food and drinking water by human and animal excreta is a potent goitrogenic agent in localities where the iodine content of the soil is low (McCarrison 1917) In regions (Himalayas) where these conditions prevail endemic goitre and its congenital manifestations are rife The incidence of the malady in its adeno parenchymatous form has been found to increase in such localities with increasing impurity of the surface waters used for drinking purposes Goitre has been produced under experimental conditions in man by the administration for some weeks of the residue left in the candle of a Berkefeld filter after filtration of this water The substitution of a bacteriologically pure for an impure water supply has caused the disappearance of the disease Animals confined in insanitary cages and fish confined in filthy tanks or ponds tend to develop goitre which can be prevented by the additional provision of iodine The scrapings from the interior of such tanks has been shown to cause goitre in animals when administered to them for some weeks

Goitre in animals and congenital goitre and cretinism in their offspring have been produced under experimental conditions by the administration to them of extracts of faecal material or of bacterial cultures made from faeces Thus a watery filtered extract of faeces when administered to female rats throughout pregnancy as their sole source of drinking water caused cretinism in some of their offspring A similar but sterile extract made from the excreta and food residues accumulating in cages wherein rats were confined caused great increase in the rate of growth of embryonic thyroid tissue *in vitro* when added to the culture medium in high dilution (1 in 500 000) when present therein in greater concentration (1 in 5 000) it inhibited thyroid growth This extract when given to rats living under conditions of perfect hygiene and fed on a well constituted diet induced goitre in 8 3 per cent of the animals When an ill constituted diet, capable, *per se* of causing goitre in 39 per cent of the animals, was substituted for the well constituted one this extract increased the incidence of the disease to 89 per cent thus emphasizing the importance of the summation of goitrogenic influences The goitrogenic action of insanitary conditions is counteracted by well constituted diets containing adequate supplies of iodine

INFECTIONS

As is well known the thyroid gland is very susceptible to stimulation by infections of various kinds Its usual mode of response to them is an increased activity characterized by epithelial hyperplasia an increased production and output of the gland's hormone and a greater or lesser disappearance of colloid from the organ But according to Thomas (1935) the gland sometimes exhibits another mode of response In this case the process of secretion and storage of colloid may predominate over that of the excretion of hormone, and the histological features of the gland tend to approach those of diffuse colloid goitre If certain germs, like the bacillus of Koch stimulate for a length of time the process of secretion [of colloid] in a dominant way obliging the colloid to accumulate in the follicles and these to increase in size, we must admit a direct action on the thyroid an action more or less specific on the part of certain microbes This observation suggests an interesting possibility concerning the pathogenesis of goitre It becomes in these conditions extremely logical to look for the aetiology of colloid goitre for example, in the action of a germ which in the manner of the bacillus of Koch stimulates [colloid] secretion in a predominant way but with a much more considerable intensity (Thomas) In this connexion one may recall the experimental production of goitre in adult animals and of congenital goitre in their offspring by the oral administration to them of cultures of faecal bacteria and the curative effect of certain intestinal antiseptics (thymol etc) and of shock doses of vaccines in early cases of parenchymatous goitre in man (McCarrison 1917)

Thomas's investigations have also thrown further light on the relation of intestinal toxaemia to the pathology of the thyroid gland—a relation the existence of which I have for many years maintained He finds that intestinal toxaemia surgically induced has a profound action in at first stimulating the organ but if long continued it induces pronounced atrophic and fibrotic changes

Prophylaxis of Endemic Goitre

Within the last few years the value of iodine prophylaxis has been placed beyond question The weekly administration to school children of tablets containing one milligramme of iodine has given excellent results in Switzerland The efficacy of iodized kitchen salt still under experimental investigation opens up a wide range of possibilities of great promise The dose of 0·5 gramme of potassium iodide to 100 kg of salt appears sufficient and is rarely followed by bad effects But iodine prophylaxis has its limitations always there is a residuum of goitre incidence amounting to about 7 per cent which it does not control (McCarrison and Madhava 1932) Besides this specific means of preventing goitre it is essential to include in prophylactic measures the provision of a well constituted diet containing all elements and complexes necessary for normal nutrition and to exclude all positive goitrogenic agents of whatever kind

J Torgensen (*Norsk Mag Laegevidensk* September 1936 p 951) who records two illustrative cases in children aged 8 and 9 years respectively states that ischiopubic osteochondritis which is an affection of the synchondrosis between the os pubis and ischium was first described by Van Neck in 1925 and in greater detail by J Heeren in 1933 It occurs in children in whom the synchondrosis is ossifying and in several cases ossification is strikingly asymmetrical The symptoms are pains in the lumbar region X rays show a swelling of the synchondrosis which is sclerotic at its margin and vacuolated in the centre The condition probably predisposes to secondary infection

THE NEW JOURNAL TYPOGRAPHY

PRINCIPLES UNDERLYING THE CHANGE

The article printed below gives a general account of the changes in type that have been made throughout the letterpress and title-page of the "British Medical Journal" under the guidance of Mr Stanley Morison

The typographical material from which the *Journal* is composed has been revised this week in accordance with a decision reached two years ago The Journal Committee, having on many occasions received statements from members that the aspect of the *Journal* was dull and the type difficult to read, set up a subcommittee to consider the matter and to make recommendations which it thought desirable, and a second committee to render them practicable Following its examination of the reports of the committees, the Council of the British Medical Association decided to take the necessary steps to bring the *Journal* into accord with modern habits of reading and modern standards of typography

Revision from Cover to Cover

It was found that the plan authorized by the Council called for revision of the *Journal* from cover to cover The revision has been thorough types of a new and more legible design have been composed in rightly adjusted columns, surmounted by new heading types of related design, and the whole bound up within a stronger pair of covers

The most striking change of all is that of the front cover, where the grey paper and the scarlet device present what are in fact the only revolutionary innovations It is as well to admit that they, like all revolutionary changes, will be approved by some and disapproved by others But it is surely fair to claim that those unprepared to abandon the Victorian gothic heading in the interest of consistency can hardly fail to approve another feature on the front cover which is one of convenience to each reader The list of Principal Contents, now for the first time selected and displayed outside the body of the *Journal*, presents an immediate gain to all whose time is precious The selection for reading of specific articles or features, and subsequent reference to them, is helped if it can be preceded by some general glance at the main contents The new displayed Principal Contents, therefore, enables the reader to single out from other matter the subjects dealt with in original papers and special articles appearing in each week's issue The full Table of Contents, now redesigned typographically, will be found in its usual place

The Primary Purpose

Every other change throughout the *Journal* is similarly practical The variations that have been made in the body of the *Journal* are structurally sound They have been made in terms of practical and specific purpose, and related to one general purpose which any reader must applaud without any reference to "matters of taste" This primary purpose was to make the *British Medical Journal* easier to read

Any change in the outward appearance of a periodical requires justification in so far as it is noticeable, for the very purpose of adopting and retaining a particular style of typography is to prevent the reader from having to notice the physical details of each successive issue He cannot immediately fix his attention on the new content while he is being distracted by changes, explained or unexplained, in the old form Familiarity breeds contentment with the printed page so long as it is perfect familiarity The most modest alteration of style or type is bound to be disconcerting, and the continuous making of piecemeal changes is the worst form of revision Hence, when for sufficient reasons a considerable typographical change is determined upon, it is desirable to make the whole change at once

Legibility and Comfort

It is claimed that the new type possesses greater legibility than the old The word "legibility," like the word "edibility," has different meanings for different speakers Both can be relative terms The processes of mental ingestion depend on the reader's frame of mind The actual muscular effort of the eyes in travelling to the right along a printed line requires, in favourable circumstances, no more conscious direction by the will than is required for mastication, and the final twitch of the eyes leftwards to the line below becomes almost as automatic as the act of swallowing

Only the satirist would employ the word "edible" to describe a meal, and there is no point in applying the word "legible" to a printed page if it connotes merely that the page can be read Anything written in the reader's language, in types which recognizably conform to the fixed code of the roman alphabet, not only can be, but will be, read if there is enough preliminary indication that its content is important to the reader

When, therefore, readers complained, as they formerly did, about the printing of the *Journal*, they reported, first, their experience that although the type then in use was legible it was not comfortable The printers may have found the types in previous use convenient to handle, and there may have been half a dozen reasons for continuing to use them But complaining readers insisted, in the second place, that they were not able to read the columns of the *Journal* with the degree of comfort they found in other reviews

Perceptibility of Type

And when the matter was looked into the Committee found, as was implied in readers' complaints against the old type, that the factor of legibility had indeed been subordinated to other considerations In the new typography now before the reader the factor of legibility has not been subordinated to any other consideration whatsoever It will be observed that the most obvious difference between the type previously used and the present is the colour The new type is blacker Before the question of legibility can even arise, a type must possess the virtue of *perceptibility* In this matter the old type was at a disadvantage even in comparison with the fount used in the *Journal* of fifty years ago The difference is accounted for by a change in the technical production Whereas fifty years ago the *Journal* was produced on the same kind of printing press as is now ordinarily used for the printing of books, the paper has for many years been printed on much faster-running rotary presses in which, on account of the speed, the ink flow is much less liberal, the impression of the type into the paper much slighter, producing a letter-form comparatively lacking in clarity and colour and therefore perceptibility The Committee rightly decided to use a blacker type

The Letter-form

Secondly, it was decided that any new fount of type should have been designed and cut with a view to its

These differences unrelated to practical efficiency or intelligence, are what we call temperamental or emotional *differences*. *It is often not realized how complex each* moment of life may be as regards possibilities of experience. For example X gives a command to A and to B, and he in all probability is only aware of what he wishes to have done. Rationally, too, A and B ought to consider it from that aspect and devise means for its execution. Reason is, however, rarely a decisive factor. That command, in addition to what is given by X, and X's manner of commanding may infuriate A and leave B unmoved. The fringe of emotional possibilities surrounding the command is sometimes more real than the content of the command, and can be reflected in the way in which X's commands are received compared with Y's. Yet A and B may be unaware of the emotional reaction. These observations are matters of daily experience, known though usually unacknowledged and there is no doubt that differences of temperamental nature are playing an important part in many problems of industrial efficiency, sickness absence, and labour wastage, as well as in personal happiness.

Now the person whose temperamental make up plays a considerable part in the efficiency and happiness of an organization is the person in authority. It is obviously very difficult to study the temperaments of different people *in authority and to relate them to differences in output* or some other measure. Such evidence as is available has been obtained as a side issue to other investigations. There is evidence of differences of output directly connected with the temperament of the supervisor—a bright healthy minded person raising the quality and quantity of work. Also a high labour wastage and high sickness rates are sometimes correlated with a bully or a 'Weary Willie' type.

Types of People in Authority

The following are easily differentiated (*a*) the emotionally disintegrated person, or in plainer language the baby, and (*b*) the emotionally adolescent.

In the former each emotion as it is aroused is expressed regardless of consequences, the slightest crossing of his wishes results in what would be called in the nursery tantrums. Anyone can easily wound his *amour propre*. He cannot bear anyone near the throne: he must be all-powerful, for not only must he have his own way but everyone must recognize that he has had it. Hence he tends to promote, in the absence of effective safeguards, *weak rather than strong people, and then complains* fretfully that nobody can take any responsibility. He also tends to believe in the all powerfulness of his wishes when, therefore, he gives an order he fails to envisage the means that often demand much time and work, so he harasses subordinates with fractious and querulous inquiries. If he has great organizing ability and the requisite physical and intellectual qualities, and the conditions are favourable, he does well—*from some points* of view—the very ruthlessness of the baby being an advantage. If he has poor or mediocre ability he drifts from one job to another, where there is no security of tenure, where there is, he makes the lives of subordinates miserable.

The outstanding characteristic of the *emotionally* adolescent is an inability to take effective responsibility. Subordinates have therefore the very difficult task of having at uncertain and irregular intervals to assume responsibility without power. Some dramatize themselves as leaders, speculate on what would happen if it were not for them, enjoy lamenting pessimistically about the state of the world in general, but seem to be unable to do what is in their power to improve their own world. To feel more sensitive than one's fellows but to be very little inconvenienced by it practically is to some people a most uplifting consolation. Such like an audience for whatever they are doing and ride on the expressed approval of subordinates, seeing to it that they are surrounded by those who will express approval. They talk much of loyalty, *which really means thinking* they can do no wrong to criticize in any way is to be disloyal.

The common factor in these undeveloped types is that they behave according to the emotion aroused in themselves by particular circumstances and not according to the circumstances themselves. Hence the apparent inconsistency of their conduct considered over a period of time.

What are the temperamental characteristics of the person in authority who is emotionally grown up? This is not easy to answer. But it is certain that the successful technician can be a very indifferent supervisor of other persons. The effect of power in some people is to let loose a number of qualities otherwise held in check.

Assuming the necessary intellectual and practical equipment I should suggest that the first requisite is a sense of justice, a capacity for asking not 'Am I getting justice?' but 'Am I giving it?" Where there is a feeling *in an organization that all will receive a fair deal* there is an excellent basis for success. Next, a capacity for sympathy, which does not mean sloppy sentimentality but the power to sense the point of view of people different from ourselves. Next, vitality, which is not mere physical exuberance but controlled energy that inspires others instead of exhausting them. Lastly, a sense of humour preventing oneself from taking oneself too seriously.

In broad outline these are some of the problems of a psychological nature that have been referred to the Industrial Health Research Board and the London School of Hygiene and Tropical Medicine either for investigation or for advice. A study of a number of industrial failures has revealed in the majority serious psychological maladjustment. The necessity for the industrial medical officer to understand the mental as well as the physical make up of people and the psychological as well as the material environment, becomes more urgent each year. Some organizations can afford to employ medically qualified men and women to look after the accidents alone, but in many this is a negligible part of the work and an infinitely greater part belongs to a different category. The problem is not whether the psychological point of view shall or shall not be taken into account: its importance is already realized by a number of organizations. The problem is whether the medical officer will be adequate to deal with it, or must it be left to others?

HEALTH OF NEW YORK CITY

In a recent communication to the Press Dr John L. Rice the Health Commissioner of New York, points out for the benefit of those who may contemplate visiting the World's Fair in 1939 that the city lately has had the lowest death rate for automobile accidents of the large cities of the United States. As the Fair is still two years ahead the prospective visitor might reasonably wish to be informed as to the probability of this recent low rate holding until the date of his visit. As the rate has been falling year by year from 19·7 per 100 000 in 1929 to 12·6 last year the time trend seems to be favourable and the prospects good.

The Commissioner draws attention also to the successful results of the intensive campaign to reduce the diphtheria mortality. In 1927 the deaths were 717 from that year they have declined steadily to 68 in 1935 and 37 in 1936 the last figure being equivalent to a diphtheria death rate of 2·2 per *100 000 children under* 15 years of age. The number of cases of poliomyelitis was reduced to 38 in 1936 in the previous year there had been 2 054 and in 1931 4 138.

Unfortunately the birth rate too has been steadily diminishing. In 1927 it was 19·6 in 1936 it was 13·4. The Commissioner takes a serious view of this tendency especially as the practical cessation of immigration from over seas has already slowed the growth of the city. It is of interest that there were three deaths from tularaemia a disease known in this country only as a laboratory infection. Wild rabbits were the probable source and among the sick were a butcher and a cook who had doubtless contracted the disease through dressing the carcasses.

should be based upon a scale of fees agreed between the committee and the hospital and should be assessed at figures which cover maintenance, accommodation, and medical and surgical treatment where the latter is provided through the scheme The organization of schemes by independent committees instead of by particular hospitals is of importance when the system is considered in its national aspect A committee which conducts a scheme on a regional basis is more likely than a single hospital board to come into contact with organizers of other schemes Such contact facilitates uniformity of practice in administration, in the nature of the benefits provided and in the remuneration of medical staffs and it permits of arrangements whereby a contributor can retain his title to benefit if he moves from one region to another

Municipal Hospitals

The advantage of a regional basis will become even more apparent when the principles of contributory schemes are applied to municipal hospitals At present only a very few schemes make payments to local authorities in respect of contributors who are admitted to council hospitals but it is a development which may well reach important dimensions in the near future Many council hospitals employ a visiting medical staff in the same way as voluntary hospitals and the method of remunerating the visiting staff in respect of contributory scheme patients may be expected to follow that prevailing in the neighbouring voluntary hospitals It is therefore important that in the meantime the organized local medical profession should consider whether its position in relation to contributory schemes accords with the principles enumerated above

INSURANCE MEDICAL SERVICE WEEK BY WEEK

The Improving Medical Service

At the meeting of the London Insurance Committee last week there was no report from the Medical Service Subcommittee and it was understood that the subcommittee had had no occasion to meet for several weeks Similarly, at the last meeting of the Glasgow Insurance Committee no cases were reported by the Medical Service Subcommittee While not jumping to too facile a conclusion that a state of Utopia had now been reached in the medical treatment of the insured population it is difficult to resist the inference that this entire absence of complaint in two great centres of population does imply that insurance practitioners are satisfactorily getting on with their job

An Avalanche of Papers

The view expressed by the chairman of the Insurance Acts Committee in the foreword to the fourth edition of *Medical Insurance Practice* (now on sale price 2s post free) that it is essential that every insurance practitioner should have in his possession a copy of this book has been endorsed in no uncertain manner by the London Insurance Committee The clerk of the committee has produced for the inspection of the Medical Benefit Subcommittee at the request of that subcommittee a special parcel of the various documents which are sent to the insurance practitioners on appointment The enclosures to the parcel are as follows

Prescription books
Certificate books (three kinds)
The National Formulary
The Medical Benefit Regulations
The Drug Tariff
Memorandum on the Keeping of Medical Records
Memorandum on Pregnancy and Parturition of Insured Married Women
Memorandum on Tuberculosis
Memorandum on Medical Certification
Memorandum on the Duties of the Regional Medical Staff
Report on the Definition of Drugs for the Purpose of Medical Benefit
Forms of notification that treatment has been afforded to insured persons presenting travellers vouchers
Envelopes for the transmission of medical cards
Envelopes for the transmission of forms of medical record
Forms of application for medical cards
Continuation cards for use in connexion with medical records
Specimens of nine other forms
Four circular letters addressed to practitioners on various subjects
Requisition form for stationery

When it is realized the Medical Benefit Subcommittee states that these documents are sent to a practitioner who may have had no previous experience of insurance medical practice we cannot think that it is in any way helpful for him to receive what might almost be regarded as an avalanche of literature primarily intended for his guidance and instruction There is no guide or index and we can well imagine a practitioner being bewildered as to which document he should consult to enable him to determine his course of action in relation to the problem with which he is faced

The report of the subcommittee proceeds as follows

The committee will be aware that for some years there has been on the market a publication known as *Medical Insurance Practice* which is the only work of reference dealing with the provisions relating to medical benefit under the National Health Insurance Act The authors of the work are Mr R W Harris and Mr Leonard Shoeten Sack both of whom were at one time officers of the Ministry of Health We have arranged for each member of the committee to be supplied with a copy of the book which has now reached its fourth edition and has been exhaustively revised in the light of the Medical Benefit Regulations 1936 which came into operation on January 1 1937 The authors have left unanswered no question upon which the busy insurance practitioner is likely to seek information An extensive index makes reference on any question a matter of merely seconds The book contains specimens of the various forms which an insurance practitioner may be called upon to use and what is more helpful a description of the forms and an explanation of the circumstances in which they should be utilized There are in addition notes of decisions by the Minister of Health on various cases which cannot but be of assistance to practitioners

The Insurance Committee upon the recommendation of the subcommittee has decided that 2 000 copies of *Medical Insurance Practice* shall be purchased and that each of the insurance practitioners in the London area should be supplied with a copy

Specialist Services

During 1936 110 notifications of specialist services rendered to insured persons by twenty two insurance practitioners were sent to the London Insurance Committee sixty two were connected with eye service twenty four were for ultra violet ray treatment for various conditions and the remaining twenty four were mainly concerned with surgical services

An Elderly Practitioner and Night Visits

In a recent medical service case a nurse on behalf of an insured patient went to the practitioner's residence

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MARCH 6 1937

THREE EVENTS IN PUBLIC HEALTH

When a distinguished public servant, after a period of probation in kindred work, has attained to a high administrative charge in the government of his country, has thereafter enriched his experience by wide excursions in other lands, and, finally, in the fullness of time has published a narrative covering the years of these, his more mature, activities, any considered opinions which he may think fit to express therein should carry weight We therefore find it worthy of notice that Sir Arthur Newsholme, in his latest book,[1] which takes up the story of his life from the date of his assuming duty as Principal Medical Officer of the late Local Government Board enumerates as the three most important external events bearing upon the progress of public health during his tenure of that position (1) the reports of the Royal Commission on the Poor Laws, (2) the coming into operation of the National Insurance Act, and (3) the declaration of war in August, 1914

The old Poor Law medical relief had been aptly described by Dr J C McVail as "a cripple supported on two crutches, the general voluntary hospitals on the one side and gratuitous medical work by private practitioners on the other" The cautious majority report of the Royal Commission on the Poor Laws recommended that the county and borough councils acting through public assistance committees, should become the authorities for institutional treatment and general supervision, that there should be co operation between the relief authorities and private charities and that outdoor relief should be conditional on good behaviour The more progressive minority report aimed at completing the break-up of the Poor Law advised the withdrawal from the relief authorities of the care of the sick, the young, and the aged, and recommended a national scheme for unemployment Contemporary discussion of these two reports tended to focus more on their divergences than on their common purpose Owing to this and other major developments including the war and the post war problems, it was not till the Act of 1929 that local government reform was attempted and the care of the sick poor at last empowered to be supplied under statutes unrelated to the Poor Law

[1] *The Last Thirty Years in Public Health Recollections and Reflections on my Official and Post Official Life* By Sir Arthur Newsholme, K C B M D F R C P George Allen and Unwin (15s)

The National Insurance Act of 1911 had in the meantime inaugurated a movement in the direction of giving effect to the recommendation of the minority report in favour of social insurance Loss of health had long been recognized as an abundant cause of loss of employment and consequent destitution, and the Act was designed to provide "for insurance against loss of health and for the prevention and cure of sickness" Insurance against the impoverishment resulting from loss of health was provided under the Act by its sickness and disablement benefits while the cure of illness was made available by means of medical benefit Since under this last there was every inducement, or at least no deterrent, to the patient consulting his doctor betimes, it has had a preventive value

The Act as a whole, though well intended fell in many respects short of completeness, yet it suffered far more in its beginnings not from its inherent defects but from the unfortunate choice of early advisers by its prime mover who as Sir Arthur Newsholme says, first approached "the friendly societies and other less desirable industrial insurance societies" and did not until the Bill had been framed seek to establish close contacts with the Local Government Board or the British Medical Association The Board could have placed at his disposal its wide experience of administration, The Association would have been able to speak with authority for the profession likely to be most affected, whether for better or for worse, by the impending new regime Though the Association in the end secured what had come to be known as its "cardinal points" the Act, when placed on the Statute Book, had to encounter in many quarters both dumb and outspoken hostility resulting from previous differences of opinion, and it needed all the driving power of Sir Robert Morant and other civil servants to set the ponderous mechanism creaking into action

Sir Arthur Newsholme speculates in an interesting way whether if the reform of local government through the creation of larger areas which took place under the Act of 1929 had been effective before the inception of the national insurance scheme, the way would possibly have been opened for the introduction at that time of a more comprehensive medical service under the more auspicious control of the public health local authorities Sir Arthur himself figures as a cordial encomiast of local authority administration mainly on the ground that local authorities had been in his experience more disposed than Government Departments to seek or follow the advice of their medical officer Indeed he goes so far as to say that for their more efficient functioning central departments would do well to approximate to the

between 10 p m and 10 30 p m, and produced the insured person s medical card to the practitioner s wife, who informed her that the practitioner did not undertake night work The messenger then indicated the nature of the illness and pressed for a visit that evening The practitioner s wife again took the card and returned with a message to the effect that the practitioner had been ill and was not doing any night work, and suggested that another doctor should be called in The messenger thereupon secured the services of the nearest doctor, who was not an insurance practitioner and he attended and continued to attend the insured person throughout her illness The Medical Service Subcommittee, in recommending that the practitioner should be censured and a sum withheld from his pay, stated

The practitioner concerned in this case is elderly and it may well be that he desires so far as possible to avoid the necessity for night visits, but he has a responsibility to his insured patients and if he is unable or unwilling to visit them when their condition so requires he has a duty to provide the services of a deputy practitioner He was at home when the application for his services was made and on his own showing all he did was to send a message that application should be made for the services of another practitioner instead of as we should have expected himself getting in touch with the deputy practitioner and satisfying himself that the deputy would attend on his behalf There is no doubt that the condition of the patient was such as to need immediate medical attention which the practitioner although available failed to provide and as a result the complainant incurred expenses in obtaining the services of another practitioner living near

The case is of interest mainly as a reminder that a duty rests upon any insurance practitioner who feels unable to undertake night visits to have a standing arrangement with a deputy who is readily available It is not possible for an insurance practitioner to secure exemption from night visits to his own patients but an elderly practitioner may expect on application to the Insurance Committee, to be relieved of the necessity for being called upon to answer emergency night calls to other doctors patients

LONDON DISTRICT MEDICAL SERVICE

The boundaries of the general relief districts throughout London have been changed and the boundaries of medical relief districts are being altered to conform with them The scheme for the reorganization of general relief districts is now awaiting the approval of the Minister of Health and it is hoped to bring it into operation on April 1 next The scheme for the reorganization of medical relief districts will operate simultaneously Consideration has been given by the Hospitals and Medical Services Committee of the London County Council to the provisional salaries and allowances of district medical officers which shall obtain after March 31 The number of persons seen by part time district medical officers during 1936 was 49 914 of whom 33 894 received treatment The number of attendances at dispensaries was 186 253 and of domiciliary visits 63 190 The volume of work during 1936 was appreciably greater than in the preceding year although in some districts there was a decrease

The total of salaries of part time district medical officers at present amounts to £20 561 Under proposals now being submitted the cost will be £800 greater These proposals for adjustments of salaries and allowances are based not only on the amount of work carried out in the existing districts during the past year but also where districts are to be altered on the estimated amount of work which will be done in the reorganized areas The salaries are to be reviewed after six months The proposed adjustments provide for an increase of salary in twenty six cases and a decrease in eighteen also for certain increases and decreases in provisional allowances The increase of salary is generally of the order of £20 to £50, but in three cases the salary is increased by over £100 The largest reduction is £85

Correspondence

THE CAPITATION FEE

SIR—I am glad to see that the British Medical Association is now making a move to promote a demand by the profession for an increase in the panel capitation fee We are told in the Press that Cabinet Ministers and county court judges are to have their salaries raised on the ground of the great increase of work All professional men nowadays are driven hard by the demands of modern civilization and none more so than doctors

The self importance of the individual has become such a cult that on the appearance of the slightest ache or pain everyone from the highest to the lowest, demands instant medical attention Newspaper articles and wireless talks on health and sickness aggravate this introspection, and the rush of living travelling by car and buses brilliantly lit streets wireless cinemas cocktail and sherry parties all produce an extreme state of nervous irritation The result is that the medical man himself of necessity a subject to some of these stimuli must deal with a public far more exacting than that of a generation ago This applies to panel patients equally with those of the better off classes

The present capitation fee is acknowledged to be inadequate and there is an excellent case for an increase on the above grounds—I am etc

methods of the best local authorities It is known, however that the British Medical Association, at the period when the Insurance Bill was under negotiation, was disinclined to entrust medical insurance to the then existing public health authorities, and it is more than doubtful whether the profession, even given an expansion of local areas such as has taken place since, would have been inspired to a new confidence in town or county councils The old order, however may be changing and new affections gaining ground It may or may not be significant that in the report of the Committee on Scottish Health Services it emerges that out of the six medical persons on the committee all but two were disposed to hand over the functions of Scottish Insurance Committees to the Scottish local health authorities

Turning now to the third of Sir Arthur Newsholme's important influences during his years of office in the Local Government Board, we observe that he quotes with approval an opinion to the effect that the war was "the most gigantic imbecility since the Crusades" It would be unprofitable to debate this point in a medical journal, but we may note with appreciation his brief review of whatever of good in public health may be claimed to have resulted from the late war An intensification of scientific progress in medicine and other fields, a new interest in nutrition—which has been well sustained—and a fresh impulse for the protection of maternal and infant life are among the benefits dearly bought by the years of conflict

Much of what we have said necessarily relates to matters which are already receding into the middle distance To many who knew of the events at first hand or themselves played a manly part in them our brief survey may read like a twice-told tale Others, more recent perhaps in medicine, may find it informative But for all of us it is good from time to time to re examine some, at least of the original foundations of our existing social fabric, in order that when we seek to raise it nearer to our cherished ideals what we add may be built with full knowledge of the facts, and so endure

THE MAUDSLEY HOSPITAL

The medical superintendent of the Maudsley Hospital, Dr Edward Mapother, has reported on its work from January 1 1932, to December 31, 1935 The period under review has been an important one, for it was marked by the working out in practice of the Local Government Act 1929 and Mental Treatment Act 1930, and also included the economic crisis The London County Council has taken a leading part in showing local authorities how to evolve a co ordinated system for dealing with mental and neurotic diseases of all kinds, for educating those employed in this work in all capacities, and for research The two Acts have much simplified the problems of determining what patients are entitled to treatment at the Maudsley Hospital, and of disposing of patients who need further institutional care The unification under the control of the L C C of a number of institutions providing nearly 35,000 beds and dealing in an adequately classified way with all grades of arrested development and mental disorder and decay gives the Maudsley access to a supply of clinical material which for abundance and variety is probably unique in the world Dr Mapother thinks that if the present opportunity is turned to full advantage the hospital may well become the main centre of advanced teaching in neuropsychiatry for the British Empire As an instalment of future development he remarks that the clinical director of the Maudsley visits the British Post Graduate Hospital each week as consultant in psychiatry and has, with the superintendent himself taken part in the refresher courses which have been organized by that hospital

The accommodation at the Maudsley Hospital has been increased in several ways Large new out-patient premises have just come into use and a garden villa has been built for eighteen patients It consists of two small dormitories, one at each end, joined by a corridor off which open two rows of rooms which are all provided for sound proofing with cavity walls, double windows, and two pairs of double doors Its success in producing quiet in the hospital and its neighbourhood is remarkable for an uneasy patient can be immediately segregated in a sound-proof room by merely removing his bed from the veranda By an arrangement with King's College Hospital the Maudsley is allowed to use its Pantia Ralli ward as an annexe This is the largest trial of psychiatric treatment that has so far been made in an English general hospital The ward holds thirty female patients in its main dormitory and five more in two double rooms and a single room Most of the patients come from other wards of King s College Hospital and its out patient department they are of a type which has no disturbing symptoms and which needs rest rather than occupation They are therefore mainly cases of combined mental and organic disorder and are very suitable for demonstrations of early minor and recoverable forms of mental disorder given in the ward by the medical superintendent Dr Mapother remarks that the experience gained shows that a single ward in a general hospital can deal properly with recent cases of mental or even neurotic disorder only under the special conditions

THE BELFAST MEETING

HOTEL AND LODGING ACCOMMODATION

The facilities for housing the members who contemplate visiting Belfast for the Annual Meeting next July have given the local committee a considerable amount of anxiety, but it is anticipated that those available will meet the requirements of all visitors A list of suitable hotels was published in the *Supplement* of February 20 (p 95) The booking of *hotel accommodation* has been placed exclusively in the hands of Messrs Thos Cook and Son, and if applications are made at their office, 27 Royal Avenue Belfast, they will allocate rooms in order of application No booking fee is charged but a small deposit will be asked for on reservation being made the deposit will be credited when the account is settled or returned if it is found that the room is not required

A register of *lodgings* is in course of preparation and various *students hostels* also are available *Booking of* these will be arranged through the Local Executive Office and applications for hostel or boarding house accommodation should be addressed to the Secretary B M A Whitla Medical Institute College Square N Belfast

A number of residents have offered *private hospitality* and this will also be available Those members desirous of utilizing this should also apply to the secretary at the above address

ACCOMMODATION AND CRUISE ON SS "ALMANZORA"

To supplement the limited accommodation in an attractive manner arrangements have been made with the approval of the Council of the Association for provision of accommodation on board the ss *Almanzora* During the period of the meeting the liner will be moored in order that members may take a full part in all the social and scientific activities Moreover the mooring berth will be adjacent to a tram service which will take members to the city centre in ten to fifteen minutes At the close

of association with a psychiatric clinic Propaganda for special wards in small clinics will, he believes, merely delay what has been found necessary over most of the civilized world—namely, the affiliation of completely organized psychiatric clinics to teaching hospitals A villa for sixty private patients, and in-patient accommodation for thirty children, are to be provided

The staff have carried out research into many aspects of mental disorder and have published a formidable list of papers Dr Mapother makes a personal appeal for a neuropsychiatric unit on Continental lines, with perhaps a hundred beds for patients whose organic nervous disease is not complicated by enough mental disorder to qualify them for admission under the Mental Treatment Act The purpose of the unit would be to concentrate upon the study in the living patient of those organic diseases in which mental disorder is apt to occur but before it actually appears Clinics of this kind, he says, have been responsible for saving 40 per cent of general paralytics and for preventing or arresting much epilepsy and encephalitis Such a unit could also correlate identifiable changes in the nervous system with mental disturbance, and thus ensure that psychiatry developed as an extension of organic neurology If the unrivalled clinical material to be found in the general hospitals of the L C C could be made available for a unit planned on these lines, the Maudsley, he says would become a neuropsychiatric institution with hardly a parallel in any other country

RETROPHARYNGEAL ABSCESS

In infancy and childhood the retropharyngeal glands which drain the nasopharynx are easily infected and readily break down and suppurate, giving rise to retropharyngeal abscess This may prove a serious complication of such a comparatively trivial complaint as a cold or sore throat, and Lyman Richards of Boston [1] who has lately reported a very careful study of 162 cases of retropharyngeal abscess, found that twelve had a fatal result Retropharyngeal abscess is almost always preceded by a varying period of illness, such as sore throat, colds otitis media, or cervical lymphadenitis tuberculous disease in the cervical spine is only a rare cause in young children The abscess develops acutely, so that in most cases some pressure symptoms, such as dyspnoea or dysphagia, or both arise within a few days, while coexistent cervical lymphadenitis is common Early and correct diagnosis is of the utmost importance if the condition is to be effectively treated but Lyman Richards warns us against attempting to examine a struggling child with a retropharyngeal abscess because fatal cessation of breathing has been known to occur from forcible opening of the mouth or the insertion of tongue depressors The safest way to examine the pharynx in the suspected case is by a gloved finger which, introduced through the mouth, palpates the posterior pharyngeal wall An x-ray examination is particularly valuable, as a lateral view may reveal an enlargement of the retropharyngeal space with encroachment on the pharyngeal or oesophageal lumen Peritonsillar abscess (quinsy), for which the condition has been mistaken, is very rare in children and unlikely therefore to confuse the issue Since incision into acutely inflamed glandular tissue is meddlesome and likely to spread infection, fluctuation should be elicited before operating Until localization as evidenced by fluctuation has occurred supporting measures of a general character with hot irrigation are indicated As has been pointed out, however, the abscess develops rapidly and then calls for free drainage Anaesthesia should be avoided since the loss of laryngeal reflexes which it brings about increases the risk of aspiration pneumonia, while local congestion may produce respiratory embarrassment that calls for tracheotomy Richards favours the internal operation, the child lying on the table with extended head and elevated shoulders, the tongue and larynx are lifted forwards with an angular tongue depressor and the posterior pharyngeal wall exposed The abscess is opened by a single adequate incision, its contents aspirated and the wound edges spread apart by opening the blades of a closed haemostat which has been introduced into it In only two of the series of cases reviewed was external drainage carried out, and both patients died A watch should be kept for secondary haemorrhage, which may necessitate carotid ligation

TREATMENT OF OBLITERATIVE VASCULAR DISEASE

During the last ten years many measures have been introduced with the object of increasing the blood flow through extremities affected by obliterative vascular disease After extended trial many of these measures have been given up, but two—namely, sympathetic ganglionectomy, and suction and pressure therapy—have established themselves as of real and complementary value A new addition to the list is intermittent venous occlusion, described by Collens and Wilensky [1] The method is based on an observation by Lewis and Grant [2] that release of a cuff congesting but not occluding the circulation to a limb is followed by a transitory increase in blood flow During the last eighteen months the authors have treated five cases of thrombo angiitis obliterans, twenty-three cases of arteriosclerosis obliterans, and one case of frost bite with gangrene by inflating a cuff on the thigh to 60 to 80 mm Hg for alternating periods of two minutes, the treatment lasting up to twelve hours a day Of these twenty-nine cases pain was completely relieved in twenty-one, partially relieved in six, and unaffected in two In seventeen cases of arterio

of the meeting the liner will leave Belfast and, proceeding via the Inner and Outer Hebrides and Scapa Flow, will cruise in the Norwegian Fjords, visiting Trondhjem, Merok, Hellesylt, Oie and other places of interest The liner will return to Southampton on August 3 This cruise has been planned by Pickfords Travel Service in conjunction with the Royal Mail Lines, and members of the Association who propose to attend the Belfast meeting and are interested in these arrangements are asked to make an early application to Messrs Pickfords at 205 and 206, High Holborn, W C 1, or at any of their branches

TABLE OF OFFICIAL DATES

March 20 Sat	Nomination Papers available (on application at Head Office) for election of (i) 22 Members of Council by Grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
April 7, Wed	Council
April 24, Sat	Publication of Annual Report of Council in *B M J Supplement* Last day for receipt at Head Office of Nominations (i) by a Division of not less than 3 Members for election of 22 Members of Council by Grouped Branches in Great Britain and Northern Ireland, (ii) for election of 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
May 8, Sat	Publication in *B M J Supplement* of list of Nominations for Election of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body Voting Papers posted from Head Office where there are contests in above elections Applications for B M A Research Scholarships and Grants must be received at Head Office by this date
May 10 Mon	Motions by Divisions and Branches for A R M Agenda on matters of which two months notice must be given must be received at Head Office by this date
May 15 Sat	Publication in *B M J Supplement* of Motions and Amendments by Divisions and Branches for A R M on matters of which two months notice must be given Representatives and Deputy Representatives must be elected by this date Last day for receipt at Head Office of Voting Papers for election where there are contests of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
May 29 Sat	Publication in *B M J Supplement* of result of election of Members of Council and result of above elections Nomination Papers available (on application at Head Office) for election of 11 Members of Council by grouped Representatives
June 2 Wed	Council
June 3 Thurs	Names of Representatives and Deputy Representatives must be received at Head Office by this date
June 19 Sat	Publication of Supplementary Report of Council in *B M J Supplement*

Branch and Division Meetings to be Held

BORDER COUNTIES BRANCH CUMBERLAND DIVISION—At Workington Infirmary, Thursday March 11, 3 30 p m Report of Executive Committee on its negotiations with the Public Assistance Committee of the Cumberland County Council, followed by clinical meeting

EAST YORKSHIRE BRANCH—Wednesday, March 10 Annual dinner

ESSEX BRANCH SOUTH ESSEX DIVISION—At Queen's Hotel Westcliff on Sea, Tuesday March 9 8 45 p m Demonstration of the late Dr R G Canti's film of 'The Cultivation of Living Tissue' by Dr J O W Bland Special B M A Lecture

HERTFORDSHIRE BRANCH BARNET DIVISION—At Old Fold Manor Golf Club Tuesday March 9 8 30 p m Talk by Dr C E Lakin

KENT BRANCH TUNBRIDGE WELLS DIVISION—At Kent and Sussex Hospital, Tunbridge Wells Tuesday March 9, 9 p m Dr E F Stowell Toxic Goitre

LANCASHIRE AND CHESHIRE BRANCH BLACKPOOL DIVISION—At Metropole Hotel Blackpool Wednesday, March 10 Mr R Watson Jones Fractures Preceded by dinner at 7 15 p m

LANCASHIRE AND CHESHIRE BRANCH ROCHDALE DIVISION—At Rochdale Infirmary Friday, March 12 8 30 p m Dr J F Wilkinson (Manchester) Diagnosis and Treatment of Some Common Anaemias

LANCASHIRE AND CHESHIRE BRANCH WARRINGTON DIVISION—At Warrington Infirmary, Wednesday March 10 8 30 p m Film on fractures

LINCOLNSHIRE BRANCH LINCOLN DIVISION—At Albion Hotel Lincoln Thursday, March 11, 8 30 p m Dr R D Lawrence 'The Practitioner and Diabetic Emergencies Preceded by supper at 7 30 p m

METROPOLITAN COUNTIES BRANCH—At B M A House Tavistock Square W C Tuesday, March 9 5 30 p m Address by Dr Cyril Norwood The Doctor—as Seen by His Patient Preceded by reception and refreshments at 5 p m

METROPOLITAN COUNTIES BRANCH CITY DIVISION—At Metropolitan Hospital Kingsland Road E Friday, March 12 4 30 p m Mr R A Fitzsimons Clinical Cases

METROPOLITAN COUNTIES BRANCH GREENWICH AND DEPTFORD DIVISION—At Chesman's Restaurant, Lewisham S E, Thursday March 11 8 p m Dinner and dance

METROPOLITAN COUNTIES BRANCH HAMPSTEAD DIVISION—At Hampstead General Hospital Thursday March 11 8 15 p m Joint meeting with Northern Section of Metropolitan Branch of British Dental Association Discussion The Value of Co operation between Doctor and Dentist To be opened by Sir William Willcox followed by Mr A T Pitts

METROPOLITAN COUNTIES BRANCH HENDON DIVISION—Tuesday March 9 Visit to Metropolitan Police College, Hendon

METROPOLITAN COUNTIES BRANCH SOUTH WEST ESSEX DIVISION—At Livingstone College Knotts Green Leyton Tuesday March 9 9 15 p m Dr Browning Alexander 'Medical Emergencies

METROPOLITAN COUNTIES BRANCH WOOLWICH DIVISION—At Woolwich War Memorial Hospital Friday, March 5 8 45 p m Clinical evening

NORTH OF ENGLAND BRANCH BLYTH DIVISION—At Thomas Knight Memorial Hospital Blyth, Wednesday, March 10, 8 p m Mr H Vernon Ingram (Newcastle upon Tyne) Some Eye Conditions in General Practice Members of the Morpeth Division are invited to attend

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION—At Alnwick, Wednesday March 17 Mr T A Hindmarsh Surgical film

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—Thursday March 11 Dr Roy Thomas 'Fundus Oculi

SOUTHERN BRANCH PORTSMOUTH DIVISION—At Queen's Hotel Southsea Thursday March 11 9 30 p m Dr F W Price General talk on Heart Disease, including a reference to Child bearing as a Complication Preceded by supper at 9 p m

SURREY BRANCH CROYDON DIVISION—At Croydon General Hospital Tuesday, March 9, 8 30 p m Dr W J O Donovan Modern Treatment of Skin Affections

SURREY BRANCH KINGSTON ON THAMES DIVISION Kingston and District Hospital, Thursday March 9 8 30 p m Dr R D Lawrence The Practitioner and Some Diabetic Emergencies

SURREY BRANCH REIGATE DIVISION—At East Surrey Hospital Redhill Tuesday March 9 8 45 p m Mr J Chassar Moir Some Common Conditions in Obstetrics and Gynaecology

SURREY BRANCH RICHMOND DIVISION—Friday March 12 9 p m Dr Robert Forbes Medico Legal Problems in Private Practice

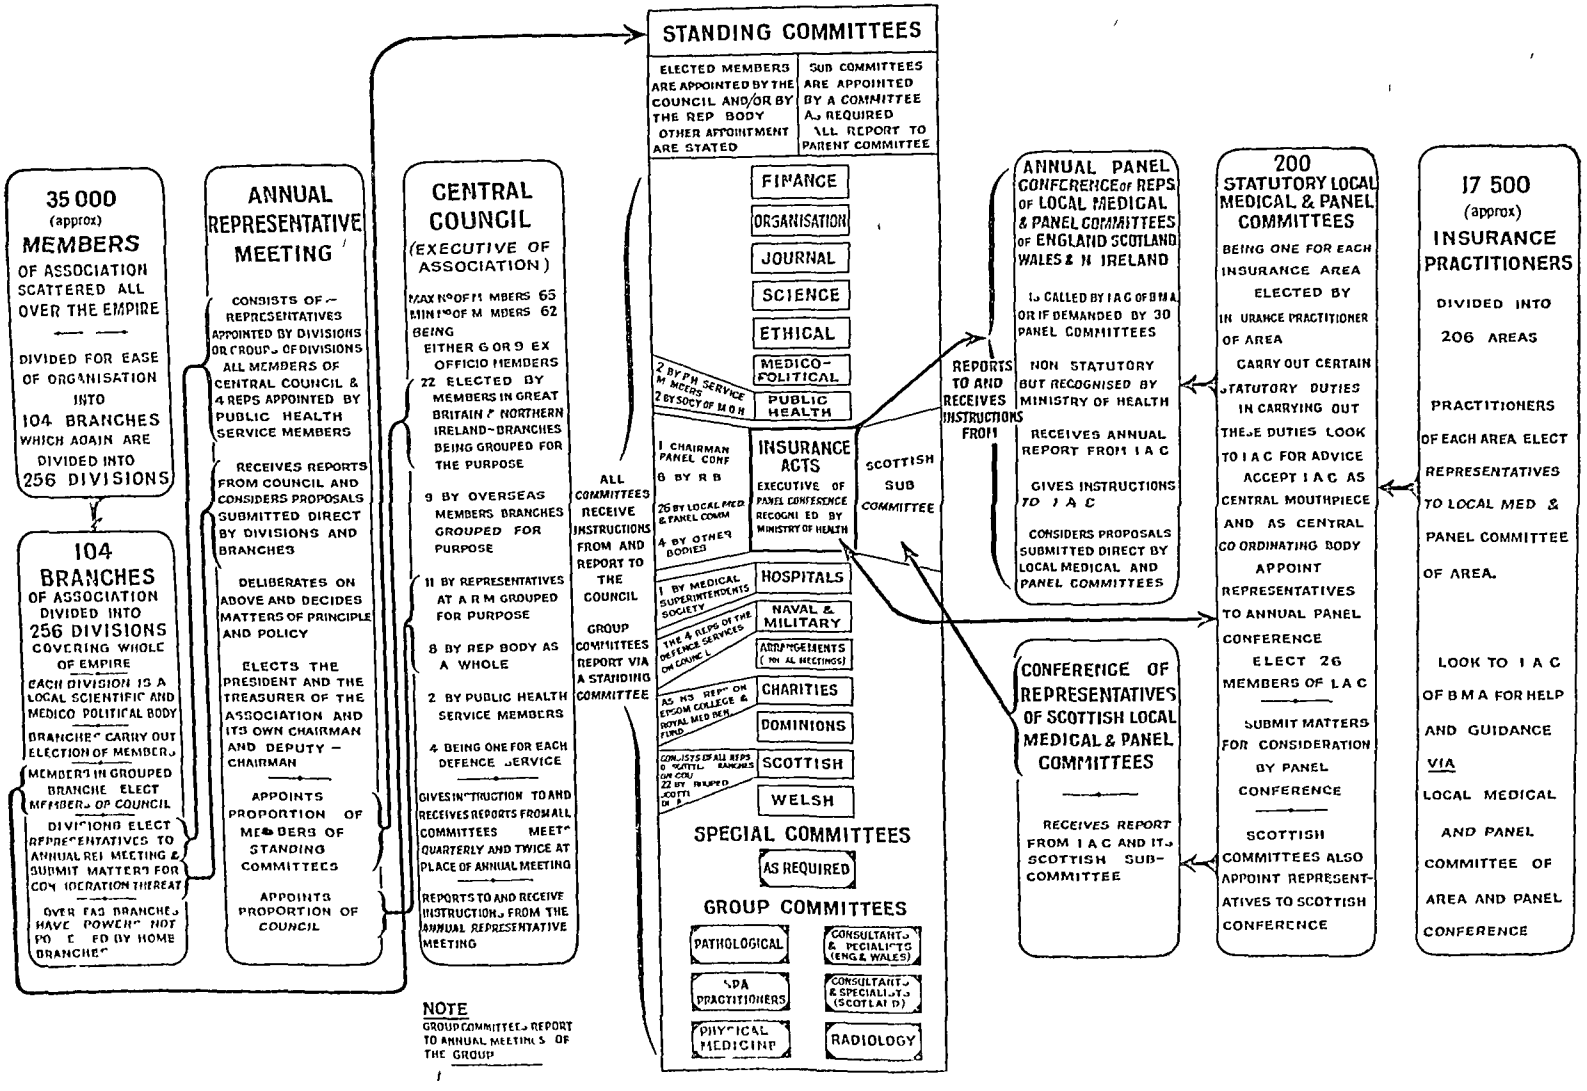
SUSSEX BRANCH BRIGHTON DIVISION—At Grand Hotel Brighton Tuesday March 9 8 30 p m Joint meeting with Brighton Section of British Dental Association Dr G L Lyon Smith 'Haemophilia' Preceded by supper at 7 45 p m

SUSSEX BRANCH WEST SUSSEX DIVISION—At Beach Hotel, Littlehampton, Wednesday, March 10, 6 p m Divisional meeting 7 30 p m, Dinner

sclerosis with gangrene or ulceration the ulcers healed in seven, improved in six, and the treatment failed in four In six cases intermittent claudication was greatly improved after two to four weeks treatment It is stated that these results were obtained in patients treated earlier by the ordinary conservative methods, and indeed one patient suffering from thrombo angitis "had received 300 c cm of 5 per cent salt solution intravenously three times a week for seven years without relief of pain or any influence on the state of his ulcer"—a persistence which would be praiseworthy in a measure adequately supported either by reason or by experience in this patient an ulcer of eight years' duration healed under intermittent venous occlusion in eight weeks It is notoriously difficult to assess the value of any therapeutic measure either on an *a priori* basis or on the report of a single series of cases In this instance the physiological basis of the treatment is not apparent for although increase in blood flow does undoubtedly follow release of partial or complete occlusion of the blood vessels to a limb, this increase is no more than enough to discharge the blood flow debt incurred during the period of circulatory obstruction (except when complete occlusion is maintained for long periods[3]) Taken at their face value the results are however impressive enough for us to hope that this method of treatment will receive a thorough trial A point in its favour is that an apparatus designed to inflate intermittently a sphygmo manometer cuff should require little ingenuity or expense to devise

MEDICAL CLASSICS

Many medical men in England hardly know the names of those who in their time have been leaders in the profession and few could pass even an elementary examination upon their periods or what they had done to become famous Pott and Colles Simpson, and even Lister denote for them conditions and not living personalities Dr Emerson Crosby Kelly of the department of surgery at the Albany Medical College has set himself to remedy this gap in medical knowledge He is editing *Medical Classics* and promises ten issues a year[4] The first part of the first volume is devoted to Sir James Paget and is wholly admirable It begins with a list of the biographies hitherto published and this is followed by a bibliography of Paget's writings, which omits to state that the address to the Abernethian Society in 1885 was printed in full by J E Adlard Then come reprints of the papers on osteitis deformans and disease of the breast illustrated by the drawings and in each case by a facsimile of one printed page of the original account There is too a frontispiece of Sir John Millais' striking portrait The block reproducing the portrait is not very satisfactory and it would have been better if it had been made from the original picture The series is well worthy of support and there are promised Sir Charles Bell Addison Brodie Hodgkin and Parkinson on the British side Oliver Wendell Holmes Morton Halsted Murphy, and McDowell on the American Billroth Banti Koch and Bassini from the Continent A noble group whose work is well worth recalling



CENTRES FOR SEX FUNCTIONS

It is now established that ovulation, menstruation and pregnancy are largely controlled by secretions from the anterior pituitary, but the regulation of the activity of the pituitary itself is unknown Investigations during the last few years have suggested that nerve fibres pass from a centre in the hypothalamus to the pituitary and that the secretion of pituitary hormones is a response to stimuli from such a centre or centres Further evidence in support of a nervous control of the anterior pituitary and generative functions has now been provided by the interesting experiments of G W Harris[1] who was successful in inducing pseudo pregnancy in rats by electrical stimulation through the head during oestrus When the oestrous cycles were of normal rhythm the animals were stimulated under ether anaesthesia at the stage of oestrus assessed by the presence of cornified cells only in the vaginal smear The stimulus used was an alternating current of 50 cycles with a voltage varying between 20 and 40 The time of stimulation was three seconds on seven seconds off, three seconds on and then this was repeated after an interval which varied between five minutes and twenty four hours The most constant results were obtained with a potential difference of 30 volts and a time interval between the two sets of stimuli of one to one and a half hours Forty-three stimuli applied at various stages of oestrus in twenty one rats gave twenty eight (68 per cent) positive responses (delays in the cycle of ten days or over) The delays were counted from the metoestrus following stimulation to the next period of oestrus Although the ovarian cycle in the rat is very difficult to follow the response to the head stimulation was shown in several ways to be a true pseudo pregnant response the most convincing method being the production of deciduomata A similar stimulus applied to the lumbar spinal cord gave no definite results The figure of 68 per cent positive results is in accordance with those obtained by other workers on the induction of pseudo pregnancy in the rat by stimulation of the cervix uteri and G W Harris's work partly confirms the experiments of F H A Marshall and E B Verney[2] who brought about ovulation and pseudo pregnancy in the rabbit by electrical stimulation of the lumbar spinal cord and head It is presumed that some part of the nervous pathway to the pituitary gland is stimulated by this means Harris's experimental work calls to mind the conclusions drawn from a clinical standpoint in a paper by G W Theobald[3] who produced clinical evidence to show that the regularity of the menstrual cycle depends on a menstruation centre in the hypothalamus and that ovulation pregnancy and parturition are similarly controlled by a centre or centres in the hypothalamus He postulated that the afferent stimuli to the menstruation centre are provided by the

ovarian hormones and by nervous stimuli from the generative organs and the cerebral cortex, and that the efferent stimuli from the centre operate through the anterior pituitary gland and to a certain extent through nervous impulses to the generative organs

VASCULAR RESPONSES TO CO_2

Changes in the tension of carbon dioxide in the blood have been shown by various investigators, working mainly with animals, to give rise to changes in blood pressure. Hyperventilation with consequent drop in CO_2 tension in the blood in anaesthetized animals leads to a fall in blood pressure. Experiments of this nature in man are complicated by the fact that there is a compensatory vasoconstriction during hyperventilation involving deep inspirations. It is possible, however, for moderate hyperventilation to be carried out for periods up to fifteen minutes without producing a vasoconstriction, as was shown by Bolton, Carmichael, and Sturup.[1] Without careful control of such complicating responses it is impossible to come to clear conclusions by experiment on human subjects. On the other hand, it is rash to apply to the human subject the results of experiments on anaesthetized animals or pharmacological tissue preparations. Bolton, Carmichael and Williams[2] have recently investigated the peripheral vascular responses to changes of CO_2 tension in the blood in normal subjects, patients with a sympathectomized limb others with a transverse lesion of the dorsal cord and others with a lesion of the brachial plexus. Those with a nerve lesion all gave clear clinical pictures. The technique of investigation was to study plethysmographic tracings, taken from toes and fingers respiratory tracings, and systolic blood pressure readings and to correlate these with the changes in the blood. The alterations in blood gas tensions were produced by breathing 10 to 20 per cent CO_2 in air, by moderate overbreathing up to fifteen minutes, by inhaling pure oxygen, by rebreathing in a closed system, the inspired air being passed over caustic potash, by breathing pure nitrogen, and by holding the breath or by rebreathing until dyspnoea supervened. In these ways it is possible to increase or decrease the partial pressures of CO_2 and O_2 in the blood and to increase the CO_2 and diminish the O_2 partial pressures. In order to alter the condition of the peripheral vascular bed the blood temperature was raised or lowered by immersion of the legs in tanks of hot water at 44° C or of cold water at 14° C. In this way general vasodilatation or vasoconstriction could be maintained for long periods. Precautions to avoid venous congestion and movement of the part on the plethysmograph and to avoid psychic disturbance of the patient have to be taken to prevent artefacts. The results obtained can only shortly be referred to, but were of great interest. Increase in tension of carbon dioxide in the blood was followed by a peripheral vasoconstriction and then by a profound vasodilatation if the original condition was one of peripheral vasodilatation. At the same time there was a rise in blood pressure. If the vessels were initially constricted there was no further constriction, but there was still a rise in blood pressure of much the same magnitude as occurred when the vessels were initially dilated. Hence it is concluded that the rise in blood pressure is due to constriction of the vascular bed in the splanchnic region and in the muscles. The subsequent dilatation and fall in blood pressure is regarded by these authors as a compensatory mechanism not related to the rise of CO_2 tension in the blood. These changes were not obtained in the affected limbs of subjects with lesions of the dorsal cord or of the brachial plexus. From this it is deduced that the effect of the carbon dioxide depends upon an intact nervous system and is independent of cardiac output (the latter view having been reached from animal experiments by other investigators). Very interesting was the finding that the effects were absent in a sympathectomized limb, but that mere severing of the somatic nerves did not abolish the response. It therefore seems justifiable to conclude that the response is dependent upon an intact sympathetic supply—that is, upon active vasomotor changes in the investigated limb—and that the control is central. These effects could be produced only when there was an increase of CO_2 tension, decreased CO_2 tension and increased or diminished O_2 tension had no such effect. The results were perhaps not unexpected but their demonstration in man presents a beautiful picture of what can be achieved by the proper use of clinical material.

EDUCATION OF THE BLIND

There was a book that was found in most households a generation or two ago entitled *Enquire Within upon Everything*. The report of the Joint Committee of the College of Teachers of the Blind and the National Institute for the Blind upon the Education of the Blind[1] might well have been called "enquire within upon everything concerning the mental, moral, social, and industrial training of the blind." We have seen no work of the kind that is so well balanced in its judgements, so complete in its survey, and so well and clearly expressed. The authors of this report gave much time through five years to its preparation and that time has been well spent. The scheme of training the blind in this country is on the whole well planned and well carried out. One of the most noteworthy features of blind training is its continuity. It starts with the nursery or infant school and proceeds to its fruition in the vocational training and the assistance or direction of the early workers. Nothing like this is to be found in the training of sighted children. These leave school for the most part at the age of 14 and their vocational training is not received through the schools, but from the drill of the employment that they happen to secure and such technical classes as they have the energy to join. The blind child is within the formative influence of a directive and happy school environment over a wide range of years from infancy to manhood. The responsibility of the teachers of the blind is therefore great. On the other hand the blind suffer severely by the loss of sight. Though they seem to the casual

Meetings of Branches and Divisions

BATH, BRISTOL, AND SOMERSET BRANCH EAST SOMERSET DIVISION

At the annual general meeting of the East Somerset Division held at Weston super-Mare Hospital on February 19 Mr K H PRIDIE gave an interesting address on the treatment of fractures He also showed a film of a new method of pinning intracapsular fractures of the neck of the femur

JAMAICA BRANCH

The Jamaica Branch of the British Medical Association has issued its *Transactions* for the year 1935–6 in pamphlet form The chief contribution is the address of the president (Dr C I Lecesne) which is a historical retrospect with an excellent bibliography, of the medical profession in Jamaica Dr Leighton M Clark contributes a short paper on Malnutrition as a Cause of Retrobulbar Neuritis in Children and Dr Dickenson one on 'Optic Atrophy in Children

KENT BRANCH EAST KENT DIVISION

At a meeting of the East Kent Division, held at Chiltonville on February 18 with Mr W E C WYNNE in the chair Mr R OGIER WARD read a paper on The More Recent Developments in the Treatment of the Prostate' and showed a number of specimens He began by describing the chief symptoms and signs of prostatic obstruction and discussed their diagnostic significance and their value as indications for treatment He referred to modern attempts to treat the condition otherwise than by prostatectomy He did not consider that endocrine therapy x ray treatment or vasal ligature could be regarded as valuable alternatives and the catheter life was more dangerous than operation Modern methods of prostatectomy were then described particularly the Harris operation and perurethral resection After a full discussion the meeting closed with a hearty vote of thanks to Mr Ogier Ward for his interesting paper

LANCASHIRE AND CHESHIRE BRANCH PRESTON DIVISION

A joint meeting of the Preston Division and the Preston Medico Ethical Society was held at Preston Royal Infirmary on February 16 when Dr FREDERICK HALL gave an address on The Control of Milk Supply Dr Hall illustrated his remarks with numerous interesting slides and a discussion followed

NORTH OF ENGLAND BRANCH TYNESIDE DIVISION

At a meeting of the Tyneside Division held at Tynemouth Infirmary on February 19 a film The Modern Treatment of Fractures was shown, Mr J K STANCER (Newcastle upon Tyne) providing an interesting commentary The report of the maternity subcommittee was considered The meeting resolved to devote the sum of £10 raised as a result of a dinner and dance to B M A charities

NORTHERN IRELAND BRANCH

A meeting of the Northern Ireland Branch was held at Whitla Medical Institute Belfast on February 4 when the president Mr H L H GREER was in the chair The crowded audience included prominent officials of the Home Office Department Belfast and representatives of municipal authorities

Major STUART BLACKMORE chief medical officer to the Air Raids Department of the Home Office London gave an address on Air Raid Precautions Major Blackmore said that no area of the country could expect immunity from attack and the warning period would be a matter of an hour or so or might even be minutes The incendiary bomb was the most important single factor in air attack as it could be carried in large numbers and consequently could start a number of fires in an attacked area Next in importance was the high explosive bomb against which there was no practicable scheme of protection Such bombs however could not be carried in any numbers on account of their relatively large size Attacks by gas bombs were considered in relation to the disorganization of civilian services and personal injuries Major Blackmore emphasized the need for organized protection and proper services for dealing with casualties and outlined methods of securing these

Mr G B HANNA K C M P, Under Secretary to the Ministry of Home Affairs of Northern Ireland, proposed a vote of thanks to Major Blackmore for his address This was seconded by Professor P T CRYMBLE and passed with enthusiasm

Major BLACKMORE gave a lecture to the students of Queen's University on February 5 and also to the nursing staffs of the various city hospitals in the King Edward Memorial Hall of the Royal Victoria Hospital

QUEENSLAND BRANCH

The following officers have been elected for 1937

President Dr F A Price *President Elect and Honorary Treasurer* Dr R G Quinn *Honorary Secretary* Dr L W N Gibson *Assistant Honorary Secretary* Dr Ellis Murphy *Honorary Librarian and Honorary Curator of the Museum* Dr Neville G Sutton

The report of the Branch for 1936 reflects a busy and interesting year Nine ordinary meetings were held, one of which was a clinical meeting In addition there was a scientific gathering each month from February to November, at which papers on a wide range of clinical subjects were read The committee responsible for arranging the programme of papers included Dr Basil L Hart and Dr J G Wagner Among other scientific occasions of the year were a lecture by Professor Winifred Cullis on Fatigue and its Prevention' the Joseph Bancroft Memorial Lecture by Professor Harold Dew on Some Aspects of Neurosurgery, and the Jackson Lecture by Dr Alex Marks entitled A Review of Midwifery Instruments since Paré The report also contains details of the work of the various subcommittees during the year

SOUTHERN BRANCH PORTSMOUTH DIVISION

At a meeting of the Portsmouth Division, held at Southsea on February 11 with Dr M ASTON KEY in the chair, binding resolutions regarding whole time public health appointments under local authorities and domiciliary attendance by a consultant were adopted The CHAIRMAN referred to the success of the annual dance of the Division and said that £100 had been collected for the charities Hearty votes of thanks were accorded Drs H H Warren and A Mearns Fraser for their efforts

Mr E W RICHES gave an address on Modern Methods of Dealing with Prostatic Obstruction The CHAIRMAN Mr N P L LUMB Mr O S HILLMAN and Drs H W JEANS W B CATHCART and C J MAYHEW took part in the discussion which followed On the motion of Mr HILLMAN seconded by Dr A MURRAY STUART a hearty vote of thanks was accorded Mr Riches for his address

SOUTH WESTERN BRANCH PLYMOUTH DIVISION

At a general meeting of the Plymouth Division, held at Plymouth on January 13 with Mr C M KENNEDY in the chair Dr T A HUNTER opened a discussion on Isolation Disinfection and Contacts in Domiciliary Cases of Minor Infectious Diseases Dr Hunter said that he included under this heading measles, scarlet fever mumps chicken pox whooping cough and German measles Some practitioners were in favour of letting all children get these diseases and so acquire immunity, and others considered that isolation of all infectious cases should be carried out with rigour Between these two extremes there existed an infinite variety of compromises and the position was an unsatisfactory one Some standard method of procedure would be a benefit, both to the public health service and to the general practitioner Dr Hunter then asked a number of questions, to which Dr T PEIRSON medical officer of health for the city, replied

Dr Peirson first emphasized the necessity for isolation of cases and the protection of contacts and the non immune public He considered that terminal disinfection was largely unnecessary, as the virus of infection in these diseases had a very short existence outside the human body An exception to this generalization was scarlet fever, in which terminal disinfection was essential The haemolytic streptococcus of scarlet fever was an organism which could be carried by persons not affected by the disease and there was little doubt that cases of infection by the organism though not producing the typical appearances of scarlet fever in a particular patient could produce that disease in others who were non immune All cases of infection by the haemolytic streptococcus therefore should be isolated in the same way as true scarlet fever It was generally agreed that infection from measles was not likely after the first week and that whooping cough was not infectious after the catarrhal stage had passed Therefore disinfection at these stages was much more valuable than terminal disinfection

Except in scarlet fever and diphtheria contacts were quite safe so long as there were no symptoms In the case of

observer to be singularly placid calm self contained, and undisturbed there is evidence to prove that this is far from the truth The limitations imposed by their handicap have a severe mental reaction Blindness is the subjective annihilation of the visible universe The blind are driven in upon themselves To sit idle is to be lost to the world and to be filled with the ceaseless turning of the mills of the mind without enough grist to grind There is a risk that the habit of brooding may be set up Hence the long continued training of the blind irrespective of the need for their industrial equipment if they are to take any place in the effective life of their time The limitation of their senses is reflected in the limitation of their industrial opportunity Nevertheless it is found that there are compensations in the mastery of manual work and that many of the blind rank on a level with the skilled worker in occupations for which they are eligible One of the problems to be faced arises from the success of the measures for the prevention of blindness Places in schools now outnumber the pupils The report suggests that reducing the number of the schools and increasing the accommodation of those retained would give greater scope for classification in training which is difficult when the numbers in any school are small

BIOLOGICAL STUDY OF DRUGS AND FOODS

The annual report of research work done in the College of the Pharmaceutical Society in 1936 contains a record of a wide variety of activities The staff of the chemical department has worked on the synthesis of new antiseptics of the acridine series and of local anaesthetics and are in process of constructing synthetic drugs with a quinine structure Dr Coward, in the nutrition department has studied improved methods for the biological standardization of the vitamins and by the use of the statistical methods introduced during recent years has succeeded in shortening some of the tests This department has carried out biological tests on the vitamin D activity of 179 cod liver oils in the year under review The average findings during the last three years show the curious result that whereas the average potency of seventy samples tested in 1934 was about 160 units per gramme the average potency of sixty one tested in the last half of 1936 was 89 units The minimum pharmacopoeial requirement is 85 units per gramme Professor J H Burn in the pharmacology department records many valuable researches A method for standardizing cortical extract has been developed which will facilitate the clinical use of this endocrine preparation Researches on the effect of vitamin deficiency or resistance to drugs have shown that vitamin D lack lowers the resistance of rats to neoarsphenamine This is a very interesting line of research because the extensive individual variation in response to drugs is an important limiting factor in some forms of therapy and any information about possible factors increasing this variation is important Another research of clinical interest is the measurement of the extent to which fever modifies the response of rabbits to insulin It has been shown that fever can abolish the response and that this inhibition does not occur in hypophysectomized animals The effect of fever on insulin is a problem of clinical importance and this work promises moreover to throw light on the mechanism of the febrile reaction

LONDON MEDICAL GRADUATES SOCIETY

The University of London lacking a long history and a local habitation has not yet gathered those traditions memories and ancient buildings that make the senior seats of learning something more than academies of instruction When in June 1933 King George V laid the foundation stone of the new headquarters he marked a definite stage in the growth of London University The magnificent new buildings now rising in Bloomsbury situated as they are between the British Museum and University College with such institutions as the London School of Hygiene and Tropical Medicine near by will when completed give London a university quarter worthy of the name The University will soon have a structure in stone and bricks to embody the corporate spirit that is so essential to its full growth and in no better way can the spirit be fostered than in the formation of societies within the University of men and women of common intellectual interests Such a society is that of the University of London Medical Graduates whose aims are set forth in a letter printed in this issue at page 531 Sponsored by Mr W McAdam Eccles Dr C A H Franklyn Mr T B Layton and Sir StClair Thomson the society was founded in 1928 Fifty members were present at the first annual dinner in May 1928 and in December 1936 the membership was 670 The growth of the society has been steady, but the membership is still small in proportion to the large number of students in the Faculty of Medicine The intense individualism of London hospitals has played a great part in their development and has been responsible for much excellent work But in this age when co operation has been found more efficient and economic than competition in many spheres of activity, individualism carried too far is apt to act as a brake on progress Some of the metropolitan medical schools have already recognized this in their efforts to pool teaching resources for the benefit of their students But for these efforts to be really successful the narrow parochialism which it must be confessed tends at times to manifest itself in London teaching hospitals can only disappear when medical graduates and students of all the hospitals can meet each other in the friendly and informal atmosphere of such a society as that of the University of London Medical Graduates Those who do not yet belong should apply for membership by writing to the honorary secretaries 11 Chandos Street Cavendish Square W 1

We are asked to state that the fourth biennial informal conference organized by the British Empire Cancer Campaign will be held on Tuesday and Wednesday March 16 and 17 at the Royal Society of Medicine Admission is by card only after application to Mr Lawrence Abel or Dr R W Scarff joint honorary secretaries of the Organizing Committee (British Empire Cancer Campaign) 12 Grosvenor Crescent London S W 1

scarlet fever school teachers and those who handled raw food should not be allowed to carry on with their occupations but might mix with others in the open air In all diseases non immune children should not be allowed to return to school until the period of quarantine was over because many of these diseases passed unnoticed in the very early stages when infection was most likely Every child contact of scarlet fever whether immune or not should undergo a period of quarantine Attendants on patients should take the precaution of washing and changing their clothes before mixing with other people Non immune children should not be allowed to mix with others in the house cinemas etc Dr Peirson did not consider it was safe to allow non immune child contacts to mix with others in the open air since it was impossible to be absolutely certain that they did not go indoors with other non immune persons Theoretically non immune contacts were safe until the minimum incubation period had elapsed

Dr Peirson went on to appeal for the home treatment of scarlet fever in Plymouth He said that 77 per cent of cases were treated in hospital and only 23 per cent at home This meant that the wards in the isolation hospital became full with cases of mild scarlet fever and prevented the admission of much more suitable patients suffering from pneumonia associated with measles or whooping cough In addition there was a greater liability of cross infection from other strains of haemolytic streptococci which produced second attacks of scarlet fever in convalescent children It was no more dangerous to nurse cases of scarlet fever at home than such conditions as streptococcal tonsillitis etc The dockyard authorities had agreed to allow their employees to return to work in spite of the presence of a case of infectious disease in the home provided they were covered by a certificate signed by the patient's doctor and countersigned by himself to the effect that the home conditions were suitable for such procedure

Free discussion followed in which the CHAIRMAN and the following took part Drs J N MORRIS D MACNAIR S NOY SCOTT W F BENSTED SMITH E MCCULLOCH D O TWINING and Lieut Colonel M ORR WILSON

Dr PEIRSON in reply to various points raised stated that the virus of influenza had a very tenuous existence outside the human host He had not considered the spraying of large buildings with disinfectants or such similar measures of any value but was strongly in favour of current disinfection by the use of gargles and other protective measures for the individual Schools should not be closed on account of infectious diseases except in very rare instances or in rural areas where children were only likely to come together in the schools

Dr HUNTER in conclusion suggested that the medical officer of health should issue a circular of suggestions for the guidance of practitioners to achieve a uniform standard in combating these infectious diseases

After some further discussion Dr TWINING proposed and Dr MACNAIR seconded a resolution to appoint a subcommittee to confer with the medical officer of health for the purpose of issuing suggestions on the lines proposed by Dr Hunter This resolution was carried unanimously

A vote of thanks to the openers of the discussion was proposed by Dr T M JAMIESON and seconded by Dr SHORE and carried with acclamation

Discussion on Ante natal Care

At a meeting of the Plymouth Division held at Plymouth on February 17 with Mr C M KENNEDY in the chair a discussion entitled Is Ante natal Care Worth While? was opened by Mr JAMES RIDDELL Summing up the advantages of ante natal care Mr Riddell said that it provided greater contact between patient doctor and nurse and the psychological effect of this contact was of the greatest importance Diet and exercise could be controlled during pregnancy The doctor could advise the mother in the choice of foods so that metabolic toxins would not arise Although ante natal care could not prevent many complications of pregnancy yet by its practice warning of them was obtained The toxaemias of pregnancy could be very largely eliminated by ante natal care These constituted a medical problem and offered great scope to the physician in this connexion Theobald had done good work in showing that the liver was the organ particularly at fault Again diet and the exhibition of calcium with vitamin D could be of value in preventing toxaemias Mr Riddell emphasized the danger of waiting too long in a case in which symptoms persisted in spite of treatment Induction was a far better procedure than running unnecessary risks Hormone treatment was being developed and some definite results had been achieved It had been shown that oestrin would expel a dead foetus and not a live one while progestin was useful in toxic albuminuria

Disproportion was easy to diagnose in the major degree but difficult in minor cases Over use of callipers led to errors as it must always be borne in mind that labour was a process of living tissues and not of dead bones By careful observation and intervention at the proper time many post partum complications could be avoided There was no merit in a successful forceps delivery if a woman's future life was to be adversely affected Caesarean section was an alternative which should always be borne in mind The anaemias of pregnancy could be detected by ante natal care It was axiomatic that anaemia like haemorrhage greatly increased the liability to sepsis Abortion could frequently be avoided by care during the early stages of pregnancy and in those cases in which abortion had occurred previously vitamin E antiutrin S and progestin had proved helpful

Mr G E LARKS considered that placenta praevia was the most dangerous complication from the medical standpoint From statistics in his possession gathered from the City Hospital it would appear that in only one third of cases which proved fatal could death have been prevented by ante natal measures Observation during pregnancy was very helpful where there was tuberculosis toxaemia or venereal disease or in any cases in which radiographic examination was of value in estimating disproportion and foetal monsters

Dr S M DAVIDSON favoured careful ante natal observation He could not agree with Mr Larks on the subject of placenta praevia he believed that adequate treatment should save every case He regarded early version as dangerous in breech cases and stressed the importance of taking blood pressure readings throughout pregnancy

Dr MABEL RAMSAY speaking from thirty years experience stated that she had been associated with the original Hudders field experiment She thought that ante natal care was well worth while even if it led only to a closer association between doctor and patient She held very strongly the opinion that midwifery should be in the hands only of doctors who were keen on it the others should cease to practise it She had found fulminating eclampsia commoner in young patients and instanced two cases

Dr E MCCULLOCH who attended his first confinement forty one years ago was inclined to think that ante natal care was being overdone In any event it should be conducted by the patient's own doctor and all clinics should be of a consultative nature He regarded ante natal care by individual doctors as of very great importance Dr C R CROFT considered that one of the most important things in ante natal work was the education of the patient in the recognition of abnormal symptoms

Dr G H S LETCHWORTH said that although 90 per cent of pregnant women did not require ante natal observation the remaining 10 per cent needed it very badly The profession therefore must legislate for that 10 per cent by undertaking ante natal work in all cases He was inclined to think that there had been of late an increase in the number of infections of the breast and wondered whether these were not due to too much handling and treatment during pregnancy He had also observed an increase in the number of retracted nipples and considered this was due to the wearing of tight brassieres He now instructed all his patients not to wear a brassiere during pregnancy The number of failed forceps cases had been greatly reduced by ante natal care and advice

Mr RIDDELL in reply agreed that blood pressure readings were of great importance and he was sure that if there was a continual rise the patient should be confined to bed He also agreed that breech cases were very difficult to diagnose and before version was attempted every effort should be made to find the cause for abnormal presentation One result of ante natal observation had been to show that the head did not engage on the thirty sixth week and that bad flexion might simulate disproportion

A vote of thanks to Mr Riddell for opening the discussion was proposed by Dr P MCC WILMOT and seconded by Dr H H COHEN and this was carried with acclamation

SUDAN BRANCH

At a meeting of the Sudan Branch held at the Kitchener School of Medicine Khartum on January 11 with Dr L D PRIDIE in the chair the following officers were elected for 19

President Mr F S Mayne *Vice President* Dr R H Blard
Honorary Secretary and Treasurer Dr R Kirk

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE PHYSIOLOGY OF THE ENDOMETRIUM AND UTERINE MUSCLE, AND OF THE OVARIAN CYCLE

BY

J. M. ROBSON, M.D., D.Sc.

During the period of sexual maturity cyclical changes occur in the uterine endometrium and muscle. These changes are closely correlated with alterations morphological and secretory taking place in the ovaries, and it is now known that the gonads directly control the condition of the uterus by means of hormones released into the blood stream. The types of cycles observed in different species and the details of the changes taking place in the sex organs of these species show almost bewildering variations. In this article it is therefore intended to consider the conditions present in the primates (especially in the human subject) and to refer to experimental findings in animals only in so far as this will clarify our understanding of the problem in primates.

Broadly speaking, the sex cycle may be divided into two main phases: (1) pre-ovulatory, and (2) post-ovulatory. Obviously the extrusion of the ovum from the mature Graafian follicle (that is, ovulation) acts as the dividing point. In the pre-ovulatory period the Graafian follicles are gradually growing and maturing in the ovaries, and these organs are releasing a hormone (oestradiol*) which controls the changes taking place at that time in the uterine endometrium and muscle. Thus this phase may also be called the follicular phase of the cycle. After ovulation a corpus luteum is formed in the site of the follicle from which the ovum has been extruded. The corpus luteum also produces oestradiol, but in addition it secretes a second ovarian hormone progesterone which is responsible for the characteristic alterations observed in the uterus during the second phase of the cycle, which may therefore be called the luteal phase.

At ovulation one of two things may happen: (1) the ovum may not be fertilized, or (2) it may be fertilized. If it is not fertilized then the period of activity of the newly formed corpus luteum is short (about fifteen days in primates) and the cessation of its secretory function (that is, of the secretion of progesterone and oestradiol) is followed by the degenerative changes in the uterine endometrium which constitute menstruation. During the period of activity of such a corpus luteum (that is, when no developing ovum is present in the uterus) alterations are nevertheless produced in the uterine endometrium and muscle which are very similar to those observed in the early stages of a true pregnancy and represent a preparation of the uterus for the nidation and development of the embryo. This phase of luteal activity, which terminates in the degenerative process of menstruation because no ovum becomes embedded in the endometrium, has therefore been termed "pseudo-pregnancy."

When ovulation is followed by fertilization true pregnancy supervenes, and the period of activity of the corpus luteum is considerably prolonged. Moreover, an organ (the placenta) develops which acts as an additional source of the ovarian hormones. For there is now considerable evidence that in some species at least the placenta may secrete both oestradiol and progesterone. In the human subject during pregnancy the placental secretion alone may be sufficient to maintain the functional alterations produced by these two ovarian hormones and thus removal of the ovaries from the pregnant woman may be followed by continuation of normal gestation leading to a normal parturition.

Changes in the Uterine Endometrium During the Ovarian Cycle

Let us now consider in some detail the actual changes in the uterine endometrium and muscle during the various phases of the sex cycle. The alterations in the endometrium have been studied in monkeys and in man by a number of observers and have for the purpose of description been divided into certain stages. These are, of course, not sharply demarcated, but gradually merge into one another. The description given by Shaw and by Schroeder on the basis of their clinical studies of the human uterus will be followed. In the early stages of the cycle (that is, in the period immediately following the end of menstruation) the regeneration of the destroyed mucosa takes place, and shortly afterwards a resting stage is reached: the mucosa is lined by a low columnar epithelium, the blood supply is relatively small and the vessels are not conspicuous. This is rapidly followed by a proliferative process. Convolutions begin to appear in the glands and by the end of the second week after the beginning of the previous menstruation all the glands are as a rule convoluted: the epithelium is of a high cylindrical type and a large number of mitoses may be observed.

This stage of the sex cycle—that is, approximately the first two weeks after the beginning of menstruation—represents the follicular phase, during which the Graafian follicles in the ovaries are gradually ripening preparatory to ovulation. The final maturation process involves only a limited number of follicles, and in primates usually only one; the antrum becomes enlarged, the follicle approaches the surface of the ovary and finally bursts and the ovum is extruded. The final growth and ovulation of a single follicle (or of a group of follicles, as is usually the case in the lower animals) is accompanied by the destruction of all remaining follicles. During the phase of follicular maturation oestradiol is secreted by the ovarian substance and by the follicles and is responsible for the proliferative processes in the endometrium which follow menstruation. A similar stage is observed in a large number of animal species in which ovulation is also preceded by proliferative changes in the uterine endometrium, produced by the hormone oestradiol secreted by the ovaries during the stage of follicular maturation. Incidentally in certain species of monkeys marked swelling of the external genitalia is observed towards the end of the follicular phase. This swelling is presumably evidence of an intense secretion of oestradiol: it can be induced in the ovariectomized animal by the injection of the hormone.

* The general term oestrin is used for a number of substances which have oestrogenic properties—that is produce alterations in the secondary sex organs of the ovariectomized lower rodents, similar to those seen at heat or oestrus. There is evidence that the substance actually secreted by the ovary is oestradiol and this term will be used when referring to that particular hormone.

HARROGATE ROYAL BATH HOSPITAL—R M O (male) Salary £156 p a

HEREFORD HEREFORDSHIRE GENERAL HOSPITAL—H S and C O (male) Salary £100 p a

HIS MAJESTY'S COLONIAL SERVICE Whitehall, S W—Chief M O for Barbados Salary £1,000 p a

LIVERPOOL ROYAL INFIRMARY—Junior C O and H S to the Skin Department Salary £60 p a

LONDON COUNTY COUNCIL—(1) Resident Medical Superintendents at (*a*) St Giles Hospital Camberwell and (*b*) St Alfege's Hospital Greenwich Salaries £1 300 £50 £1 550 p a and £1 100 £50 £1 350 p a respectively (2) A M O s (Grade I, unmarried) for (*a*) Hackney Hospital E (*b*) Mile End Hospital E (*c*) St Giles Hospital S E (*d*) St James Hospital S W (*e*) St Mary Abbots Hospital W (*f*) St Mary, Islington Hospital N (*g*) St Olave's Hospital, S E (*a*) (*b*), (*c*) (*e*) and (*f*) male appointments only Salaries £350 £25 £425 p a each (3) A M O s (Grade II) at (*a*) Fulham Hospital W (*b*) Hackney Hospital, E, (*c*) Highgate Hospital N (*d*) New End Hospital Hampstead, N W, (*e*) St Charles Hospital, Ladbroke Grove, W (*f*) St Clement's Hospital Bow Road E, (*g*) St Olave's Hospital Rotherhithe, S E (*c*), (*d*), and (*f*) males only Salaries £250 p a each (4) Temporary District M O for Area V District B (City of Westminster) Provisional salary £150

LONDON HOMOEOPATHIC HOSPITAL Great Ormond Street, W C—H P Salary £100 p a

LONDON HOSPITAL E—First Assistant and Registrar to the Neuro Surgical Department

LOUGHBOROUGH AND DISTRICT GENERAL HOSPITAL—R H S (unmarried) Salary £175

LOWESTOFT BOROUGH AND PORT SANITARY DISTRICT—M O H and School M O Salary £900 £1 000 p a

LOWESTOFT AND NORTH SUFFOLK HOSPITAL—J H S (male) Salary £120 p a

MANCHESTER—Deputy Medical Superintendent at Booth Hall Hospital for Children Salary £550 p a

MANCHESTER EAR HOSPITAL—R H S Salary £120 p a

MANCHESTER ROYAL EYE HOSPITAL—J H S Salary £120 p a

MANCHESTER ST MARY'S HOSPITALS—(1) Two H S for Whitworth Street West Hospital (2) Two H S for Whitworth Park Hospital Salaries £80 p a each

MANSFIELD AND DISTRICT GENERAL HOSPITAL—R S O Salary £250 p a

MARGATE AND DISTRICT GENERAL HOSPITAL—R M O (male) Salary £150 p a

MIDDLESEX COUNTY COUNCIL—(1) P to the County Sanatorium Hatchfield Salary £1 000 £50 £1 500 p a (2) District M O and Public Vaccinator for Shepperton and Littleton Salary £50 p a

NELSON HOSPITAL Merton S W—R H S (male unmarried) Salary £100 p a

NEWCASTLE THROAT NOSE AND EAR HOSPITAL—(1) Hon S (2) Two Hon Assistant S (3) H S Salary £100 p a

NEWCASTLE UPON TYNE CITY AND COUNTY—H S (male) for Newcastle General Hospital Salary £150 p a

NEWCASTLE UPON TYNE ROYAL VICTORIA INFIRMARY—Whole time Junior Surgical Registrar Salary £150 p a

NORTHAMPTON GENERAL HOSPITAL—(1) H P (2) Three H S (3) H S to the Ear Nose and Throat Department (4) C O Males Salaries £150 p a each

NORWICH NORFOLK AND NORWICH HOSPITAL—H S (male unmarried) to the Special Departments Salary £120 £160 p a

NOTTINGHAM CITY—(1) Resident Medical Superintendent to the City Hospital and M O to the City Institution Salary £1 000 p a (2) A M O (female) for Maternity and Child Welfare Work Salary £500 £25 £700 p a

NOTTINGHAM GENERAL HOSPITAL—(1) H P (2) H S Males Salaries £150 p a each

OLDHAM ROYAL INFIRMARY—C O and H S for the Fracture Department Salary £175 p a

PETERBOROUGH AND DISTRICT MEMORIAL HOSPITAL—R H P (male) Salary £135 p a

POOLE CORNETT AND EAST DORSET HOSPITAL—(1) R S O (2) H P Males, unmarried Salaries £200 p a and £150 p a respectively

PLYMOUTH CITY—J A M O (female) for the City General Hospital Salary £250 p a

PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY—H S (male unmarried) for the Eye, Ear Nose and Throat Department Salary £150 p a

PRESTON LANCASHIRE COUNTY COUNCIL—J H S (unmarried) at Biddulph Grange Orthopaedic Hospital Salary £200 p a

PRINCESS ELIZABETH OF YORK HOSPITAL FOR CHILDREN Shadwell E—H P Salary £125 p a

PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN St Quintin Avenue W—(1) Hon Radiologist (2) H P (male) Salary £120 £150 p a

READING ROYAL BERKSHIRE HOSPITAL—(1) H S (2) C O (3) H S to the Special Departments Males Salaries £125 p a each

ROTHERHAM COUNTY BOROUGH—Senior R A M O and Maternity Officer at Alma Road Hospital Salary £500 £25 £600 p a

ROYAL CANCER HOSPITAL (FREE) Fulham Road S W—(1) H S (2) H S for Radium Department Salaries £100 p a each

ROYAL NATIONAL ORTHOPAEDIC HOSPITAL Great Portland Street W—Two H S (males unmarried) Salaries £150 p a each

ROYAL NORTHERN HOSPITAL Holloway N—(1) Surgical Registrar Honorarium £300 p a (2) H S Salary £70 p a (3) Consulting Physicist

ROYAL SOCIETY OF MEDICINE Wimpole Street W—Nichols Fellowship Value £150 p a

ST JOHN'S HOSPITAL Lewisham S E—(1) Hon Assistant S (2) Hon Dermatologist

ST MARY'S HOSPITAL FOR WOMEN AND CHILDREN Plaistow E—Hon Assistant Gynaecologist

ST PETER'S HOSPITAL FOR STONE etc Henrietta Street W C—H S (male) Salary £75 p a

SCUNTHORPE AND DISTRICT WAR MEMORIAL HOSPITAL—H S (male) Salary £175 £200 p a

SHEFFIELD CITY—Police Surgeon Salary £1 000 p a

SHEFFIELD JESSOP HOSPITAL FOR WOMEN—H S (male, unmarried) Salary £100 p a

SOUTH LONDON HOSPITAL FOR WOMEN Clapham Common S W—Senior Clinical Assistant (female)

STAFFORD STAFFORDSHIRE COUNTY COUNCIL—(1) Assistant County M O H and M O H for the Dalton Urban District Salary £800 p a (2) Second Assistant Bacteriologist and Pathologist Salary £700 £50 £850 p a

STAFFORD STAFFORDSHIRE GENERAL INFIRMARY—H S Salary £ 00 p a

STOCKPORT INFIRMARY—H S (male unmarried) Salary £150 p a

STOKE ON TRENT BURSLEM HANLEY AND TUNSTALL WAR MEMORIAL HOSPITAL—R H P Salary £150 p a

SURREY COUNTY COUNCIL—A M O (male) Salary £600 £20 £700 p a

SWANSEA CLEN COED HOSPITAL—Deputy Medical Superintendent (male) Salary £525 £25 £575 p a

SWANSEA GENERAL AND EYE HOSPITAL—H P (male unmarried) Salary £150 p a

WAKEFIELD CLAYTON HOSPITAL—H S and H P Salary £150 p a

WALSALL GENERAL HOSPITAL—H S Salary £150 p a

WARRINGTON INFIRMARY AND DISPENSARY—(1) Second Resident (2) Third Resident Unmarried Salaries £175 p a and £150 p a respectively

WEST HOSPITAL Grove Road Balham S W—J R M O (male, unmarried) Salary £150 p a

WEST BROMWICH AND DISTRICT GENERAL HOSPITAL—(1) H S (2) H P (3) Casualty H S Unmarried Salaries £200 p a each

WEST LONDON HOSPITAL Hammersmith W—(1) H P (2) H S (3) H S with Throat Nose and Ear duties Males Salaries £100 p a each

WHITEHAVEN AND WEST CUMBERLAND HOSPITAL—H S Salary £150 p a

WIMBLEDON HOSPITAL Thurstin Road, S W—R M O (male) Salary £150 p a

WORCESTER ROYAL INFIRMARY—Hon Anaesthetist

WORTHING HOSPITAL—(1) H S (2) H P Males Salaries £150 p a each

WREXHAM AND EAST DENBIGHSHIRE WAR MEMORIAL HOSPITAL—Two R H S Salaries £150 p a each

NOTES OF THE WEEK

Sir Charles Hastings Lecture

The first Hastings Lecture to be delivered in Scotland was given by Professor E P Cathcart Regius Professor of Physiology University of Glasgow in the McLellan Galleries Glasgow on February 23 The subject of the lecture was Food and Nutrition Mr Walter Elliot Secretary of State for Scotland presided and there was an attendance of over 700 including representatives of the University the Royal Faculty of Physicians and Surgeons the Corporation of Glasgow the voluntary hospitals and other public bodies The vote of thanks to the chairman was proposed by Dr J B Miller chairman of the Scottish Committee An abridged report of the lecture was published in the *Journal* of February 27 (p 435) The Scottish Committee was responsible for the general organization, the detailed arrangements being made by the Glasgow Division with the co operation of Dr A S Macgregor, medical officer of health Mr Phillips, clerk to the Glasgow Insurance Committee and Mr Henderson clerk to the Panel Committee

Honorary Staff of Sunderland Royal Infirmary

Certain changes are to be made in the medical staffing of the Sunderland Royal Infirmary and the Children's Hospital A consulting orthopædic surgeon is to be appointed immediately, and when the next vacancy occurs on the senior honorary staff a general surgeon interested in gynæcology is to be appointed It is also proposed to appoint consulting honorary surgeons in thoracic and neurological surgery Honorary surgeons on the staff of the hospital will in future be debarred from general practice and assistants will be warned on appointment that they will not be considered for senior positions unless they are prepared to give up general practice

Hounslow Hospital Medical Staff Appointments

At the monthly meeting of the Hounslow Hospital Management Committee the procedure concerning appointments to the medical staff was discussed A special subcommittee recommended that an Appointments Committee should be formed consisting of the honorary consulting staff, the chairman of the Management Committee and the chairmen of the House and Finance Subcommittees Medical members present pointed out that this proposal ignored the Medical Committee and it was finally arranged that when a new resident medical officer was being appointed the Medical Committee on which the honorary consulting staff would be represented, should select three or four names for submission to the House Committee, which would make the appointment

Economic Courses for the American Medical Student

The subject of medical economics is securing a place of increasing importance in the curriculum of the American medical student and in response to requests for suggestions on the content of medical economy courses the Bureau of Medical Economics of the American Medical Association has prepared a skeleton course as an aid to persons organizing such courses for medical students The outline course is divided into sixteen sections which include, besides public health industrial state medicine sickness insurance the study of methods of payment for medical service conditions determining medical income the number and distribution of medical practitioners, the value cost of production and organization of medical services, and business methods for medical practitioners

Health Insurance in British Columbia

A compulsory health insurance scheme is to be introduced in British Columbia on March 1 The annual capitation fee is to be 16s 8d and the scheme includes the provision that in order to protect doctors from unnecessary calls the patient shall pay his doctor 4s 2d for the first call if it is made during the day and 6s 7d if it is made during the night These charges are in addition to the ordinary contribution

Wallsend Public Medical Service

The Secretary of the Wallsend Willington Quay and District Public Medical Service reports that since the inception of the service the medical practitioners have succeeded in increasing the capitation fee by 11d per person at risk Of this increase 4½d has been secured during the last twelve months

Sir Henry Newland

The gold medal of the Federal Council of the British Medical Association in Australia has been awarded to Sir Henry Newland of Adelaide

---

Dr W J M Baird has been adopted as candidate in a by election to the Blackpool Town Council

Immediately after ovulation there is haemorrhage within the cavity of the follicle The follicular epithelial cells are, however, nearly all retained, and, indeed the essential part of the corpus luteum is formed chiefly from these cells, which begin to hypertrophy immediately after ovulation there is no evidence though of cell division Very soon the clot organizes and there is growth of connective tissue from the theca The hypertrophy of the epithelial cells continues and the mass is penetrated by connective tissue The corpus luteum then becomes fully organized and the follicular epithelial cells contain the characteristic lutein of the fully formed corpus luteum The cavity in the organ also gradually disappears

After ovulation certain well defined changes occur in the uterine endometrium The glands become fuller, wider, and richly convoluted Translucent areas are to be seen behind the nuclei of the gland cells, which shortly begin to secrete About a week after ovulation additional changes appear and three layers can now be distinguished in the endometrium

1 A layer immediately below the surface epithelium in which the cells are tightly packed round the gland ducts

2 An oedematous layer which surrounds the glands and in which dilatation of the capillaries has occurred

3 A basal layer in which the oedema and hypertrophy are absent

The hypertrophy continues up to the twenty eighth day after the beginning of the previous menstruation, and degeneration then sets in in the form of disorganization and disintegration of the glands of the superficial and middle zones Following this, and apparently as a secondary phenomenon, blood is extravasated and haematomata form The blood and epithelium are then shed (menstruation) and regeneration of the epithelium subsequently takes place, thus starting again the follicular part of the cycle

The period between ovulation and menstruation represents the luteal phase of the cycle for the non pregnant subject During this period both progesterone the specific luteal hormone, and oestradiol are produced in the primates the corpus luteum secretes both these hormones, and degeneration of the corpus luteum is followed by menstruation In lower species too, ovulation is succeeded by the formation of corpora lutea which even in the absence of pregnancy, usually have a definite period of secretory activity In many animals specific changes are induced in the uterine endometrium by the luteal secretion homologous to the secretory phase in the primates and constituting a preparation for the nidation of the ovum, but the cessation of the luteal function at the end of pseudo pregnancy is not in the lower animals accompanied by the marked degeneration of the endometrium observed in the primates at menstruation

Changes in the Uterine Muscle During the Ovarian Cycle

In addition to the well known changes in the endometrium certain alterations have also been described in the uterine muscle during the various phases of the sex cycle though there is much difference of opinion as to the changes occurring in primates For this reason the experimental data in some animals which led to the investigations in Man will first be given

Two main and antagonistic actions have been extensively investigated in the rabbit (1) an increase in physiological activity, and (2) a decrease in physiological activity Certain criteria have been elaborated for the measurement of the physiological activity of the uterine muscle These are (*a*) the reactivity of the muscle to oxytocin—that is the dose of oxytocic hormone of the posterior pituitary lobe necessary to cause contraction of the muscle either *in situ* or suspended (in strips) in some oxygenated physiological solution and (*b*) the spontaneous rhythmic contractions exhibited by the muscle *in situ* a method of measurement being used which will disturb the uterus as little as possible and not stimulate the contractions

Now in the rabbit an increase in physiological activity is witnessed during the follicular phase of the cycle, and it can also be brought about by the injection of oestrin into the ovariectomized animal Hence during this phase of the cycle the muscle will contract when quite small doses of the oxytocic hormone are injected intravenously into the animal, or are added to the bath of physiological solution in which the muscle is suspended On the other hand, a decrease in physiological activity of the uterine muscle is seen after ovulation during the luteal phase of the cycle and this decrease can also be produced by the injection of progesterone in animals which have passed through a (natural or experimental) follicular phase In the luteal phase the uterine muscle does not respond to large doses of oxytocin injected into the animal or added to the solution in which it is suspended and its rhythmic contractions *in situ* are small or absent

Preliminary investigations of the uterine muscle in Man suggested that alterations occur similar to those obtained in the rabbit It was apparently found that during the follicular part of the cycle—that is for about a fortnight after the beginning of menstruation—the uterine muscle would contract after the injection of an extract of the posterior pituitary lobe and that it showed quite appreciable spontaneous rhythmic contractions On the other hand after ovulation and the formation of a corpus luteum (that is, during the luteal phase of the menstrual cycle) the reactivity of the uterine muscle to the posterior pituitary extract was abolished and the contractility of the muscle was depressed The onset of menstruation after the degeneration of the corpus luteum was again accompanied by a return of the reactivity and activity of the uterine muscle Hence as in the rabbit, the follicular phase of the human cycle was apparently accompanied by an increase in the activity of the uterine muscle while in the ensuing luteal phase there was a decrease in this activity

Later observers however, have been unable to confirm these results and there is strong evidence now that under certain conditions of registration the uterine muscle may show rhythmic contractions and a response to an extract of the posterior pituitary lobe during the luteal phase of the cycle too This evidence also agrees with experimental data which have been obtained on other animals For it has been demonstrated that the luteal hormone progesterone does not inhibit the physiological activity of the uterine muscle in any species so far investigated other than the rabbit which it would appear is exceptional in so far as the specific action of progesterone on the uterine muscle is concerned

On the other hand there is stronger support for the view that the follicular hormone oestradiol increases the activity of the uterine muscle in several species and that it may be a factor in controlling the activity of the muscle in primates Further investigations of these questions are however necessary and in the meantime it appears desirable to reserve final judgement

The Anovular Cycle in Primates

The general description so far given for the alterations in the uterine endometrium during the various stages of

HOSPITAL CONTRIBUTORY SCHEMES AND MEDICAL PRACTICE

Contributory schemes are now an important and permanent feature of hospital organization in this country The application of the insurance principle to the risk of illness and hospital treatment is sound and is to be encouraged among the very large section of the population known as the working class These people cannot pay the full cost of their maintenance and treatment in hospital, but they are able and willing to make some contribution towards it Contributory schemes enable them to do this in small weekly payments

Effect on Medical Practice

There are at present over 300 contributory schemes in England, Wales and Scotland The total number of persons who receive hospital benefit through them must be very considerable and the nature of the arrangements made for the provision of hospital benefit and the effect of the schemes on medical practice are therefore questions which merit the serious attention of the organized medical profession In spite of the fact that the hospital benefit provided usually includes medical and surgical treatment a large number of schemes have been established without any consultation with the local profession The reason for this probably lies in the traditional gratuitous services given by the profession to voluntary hospitals and in the assumption that these services will continue to be forthcoming either without payment or for a nominal fee This assumption is rapidly losing its validity, and it can be shown that in many areas the development of contributory schemes which ignore the interests of the medical profession has seriously affected medical practice Divisions and Branches of the B M A should therefore exert their influence when new schemes or extensions of old ones are under consideration to secure that the arrangements for the medical benefit accord with the ideals of the profession and private practice is protected from encroachment Recent successful action in several parts of the country has also shown that it is not too late to persuade boards of management or other organizing bodies to modify existing schemes

Income Limits

The British Medical Association suggests that there are three fundamental principles which should guide the profession when advice is given on contributory schemes The first is the imposition of an income limit This is of great importance in many respects Hospital accommodation is limited and if persons above the ordinary hospital class are permitted to enter those institutions through the medium of contributory schemes they are depriving less fortunate individuals of the opportunity of obtaining hospital treatment to which they are justly entitled The consultant also loses work which he might reasonably expect in his private practice and through which he is able to give his services gratuitously or at a modified fee to poorer persons in hospital There is no excuse for the utilization of contributory schemes by well-to do persons there are private hospitals and wards and pay bed accommodation for those who can afford to pay the full cost of their treatment but who wish to avail themselves of the services which can be obtained only in hospital The serious effect on private consultant practice of no income limit in a local contributory scheme or of a limit that is too high has been illustrated in a recent case in which the consultants of a certain town found that as a result of a very high income limit practically the whole of their private work had been transferred to the local hospital The Association recommends the following scale of income limits, subject to economic and local variation and periodical revision

CLASS I—*Limit of Income £200 or £4 a Week*

(*a*) Single persons over 16 years of age

(*b*) Widow or widower without children under 16 years of age

CLASS II—*Limit of Income £250 or £5 a Week*

(*a*) Married couples without children under 16 years of age

(*b*) Persons with one dependant under 16 years of age

CLASS III—*Limit of Income £300 or £6 a Week*

(*a*) Married couple with a child or children under 16 years of age

(*b*) Persons with more than one dependant under 16 years of age

Remuneration of Medical Staff

Another principle to which the Association attaches great importance is the remuneration of the medical staff It is now generally agreed that when the board of management of a voluntary hospital enters into a financial agreement with a public body or other organization for the acceptance of patients the payments arranged should cover not only the cost of maintenance but also the cost of medical treatment The most popular method of remunerating the medical staff is by the allocation of a certain percentage of the hospital receipts from contributory schemes to a fund placed at the disposal of the visiting medical staff The actual percentage will, of course be a matter for local arrangement, but the Association has suggested that in a hospital with a resident medical staff the allocation should be not less than 20 per cent

Admission of Contributory Scheme Patients

The criterion for admission to hospital should always be suitability for hospital treatment Contributory scheme patients are often admitted without question for conditions which might equally well be treated by a private practitioner This again is an abuse of hospital accommodation It is specially evident in out-patient departments where much of the treatment given is such as a general practitioner could provide Out-patient departments should be maintained primarily for consultative purposes and for the provision of such treatment as cannot be given by a private practitioner outside the hospital The Association therefore recommends that contributory scheme patients and others should except in an emergency be admitted to hospital only on the recommendation of the attending practitioner

Administration of Schemes

This indiscriminate admission of patients is often due to the fact that contributory schemes are organized by particular hospitals or groups of hospitals The Association is of the opinion that a hospital should not undertake any insurance risk It believes that the interests of all concerned are better served when the contributory scheme is organized by an independent committee This committee, on which contributors and the hospital or hospitals concerned should be represented should pay to the hospital an agreed sum per week for each of its contributing members who receives treatment in the hospital as an in-patient and a definite amount for each contributing member who receives treatment in the out patient or a special department of the hospital These payments

the menstrual cycle probably applies to the great majority of cases where the cycle is divided into two stages (that is, *follicular and luteal*) *separated by ovulation* There is, however, no doubt that occasionally menstrual discharges may arise in the absence of ovulation This phenomenon was first noted in monkeys, which were kept under experimental conditions and at times showed regular cyclic discharges of blood which could not be *differentiated* from normal menstruation (apart from an examination of the uterine endometrium or of the ovaries), although there had been no ovulation and no formation of corpora lutea There is now evidence that such anovular cycles also occasionally appear in women, though there is some difference of opinion as to the frequency of these

It seems likely that the sequence of events in such cycles is somewhat as follows The follicular stage is normal and the follicles gradually mature to the usual pre-ovular condition But the final ovulation does not take place (possibly because of a deficient pituitary stimulation) and atresia of the follicles then supervenes The secretion of oestradiol is, however, continued by the ovaries and decreases at the usual time, leading to uterine bleeding In those circumstances there is bleeding from a proliferated endometrium subjected to the action of oestradiol only, and not, as is usually the case, from a secretory endometrium subjected to the action of progesterone and oestradiol

There has been some discussion as to whether the term "menstruation" should be applied to the bleeding in such anovular cycles, and it has been suggested that the nomenclature should be reserved for bleeding from an endometrium brought to the secretory stages under the influence of the hormone produced by the corpus luteum As it is difficult to differentiate between the two types it seems probable that cyclical uterine bleeding in primates will be called menstruation, even when there is no ovulation It is important, however, to realize the functional difference between ovular and non ovular menstruation, since in the latter there can be no fertilization and no implantation Indeed, there is some suggestion that certain cases of sterility in women are due to the occurrence of non-ovular menstrual cycles

Under certain pathological conditions the follicular phase, which generally ends at about the middle of the menstrual cycle, is continued Ovulation and corpus luteum formation do not occur, but the secretion of oestradiol goes on beyond the normal duration of the cycle The uterine endometrium is thus acted upon by the follicular hormone for long periods, and *pathological* changes take place in it which result in the prolonged bleeding which constitutes metropathia haemorrhagica Since this condition is due to the continued action of the oestrous hormone without any luteal secretion whatever, treatment with *progesterone appears to be indicated and* has indeed been used successfully Incidentally, gonadotropic hormone preparations have also been used successfully in the treatment of metropathia, but their mode of action is at present unknown

(To be continued)

The Trustees of the Rockefeller Foundation have given a further research scholarship for a year to the Institute of Medical Psychology (Tavistock Clinic), London The fellowship is held by Dr A T Macbeth Wilson who is engaged on the study of certain diseases—peptic ulcer, essential hypertension diabetes mellitus and Graves's disease—whose onset has often been related to emotional disturbances in the lives of patients

SURGERY OF THE THYROID GLAND

LECTURES BY SIR THOMAS DUNHILL

LECTURE II

In his second lecture delivered at the Medical Society of London on February 24, SIR THOMAS DUNHILL dealt with the complications of toxic goitre Those affecting the cardiovascular system were the most common It was not so much the intensity of the intoxication as the age or quality of the heart muscle which determined its breakdown Considering the prevalence of the disease up to early adult life the proportion of cases of heart failure during that period was small In elderly patients on the other hand, the incidence of cardiac complications was high despite the well-known fact that symptoms might be mild His impression was that the number of patients gravely ill with congestive heart failure who came for operation was tending to decrease, but the number coming with auricular fibrillation before a severe grade of heart failure had arisen was large and increasing, the reason being that when a patient was found to have auricular fibrillation a goitre was now looked for as a possible cause It was becoming recognized that a long standing goitre, frequently regarded as innocuous might lead to this trouble Some of his cardiologist friends maintained that thyrotoxicosis did not actually damage the heart muscle, in the majority of cases when the toxicity had been eliminated recovery appeared to be complete But it must be remembered that thyroid toxaemia often continued into the period of life when arteriosclerosis or other degenerative processes were commonly seen

Heart Risk

When the operation began to be practised it was quickly realized that the attendant heart risk could not be ignored The first question was, and still remained whether the heart was strong enough to stand the operation Lists of contraindications were published, and prominent on those lists was enlargement of the heart, irregular rhythm, and congestive heart failure It was also thought that even though thyroid intoxication had caused breakdown and the toxic goitre had burnt itself out the damage to the heart was permanent and nothing could be achieved by operation He was speaking of views current from thirty to twenty years ago, but it might surprise his hearers as it had surprised him to know that he had been met recently with the same objection by two men occupying high positions in the profession in London

The total number of cases with fibrillation and congestive heart failure on which he himself had operated was 305, the number that had regained normal rhythm was 248, or 81·3 per cent Among these the rhythm returned spontaneously in 147 and quinidine had *to be used* to bring it about in 101 It was expedient to give quinidine if the rhythm did not become regular seven or eight days after the operation A very few patients had proved intractable to this while in the surgical wards, but some or most had regained normal rhythm when later admitted to the medical wards Other factors, such as arteriosclerosis or endocarditis, might be present and account for failure in some cases

Following operation and with adequate time given for recuperation many patients appeared to regain normal health Others lived happy and tranquil lives so long as they kept within the limits of their strength Some felt so well that it was difficult to keep within those limits, and they paid the penalty

High Blood Pressure

The association of high blood pressure with toxic goitre concerned the physicians primarily, but it was of importance to surgeons also Any surgeon who saw many cases

* Continued from p 461

suitability for fast rotary printing Another quality demanded from the new type was that it should be free from eccentricity Immediate recognizability was insisted upon There is nothing unfamiliar in the shapes of the letters now before the reader The letter form, being perceptible because it had the right weight, and clear because it had the virtue of plainness, needed also to be consistently drawn, cut and composed before it could possess the crowning virtue of legibility The width of the column of the *British Medical Journal* just over three inches, has been consistent for thirty years That measure is intimately related to the dimensions of the paper As there seemed no good reason for changing either, the problem resolved itself into the provision of a fount of type yielding the optimum number of characters of sufficient weight and plainness to be accommodated comfortably into a column of the measure of the *British Medical Journal*

The apparent increase in the size of the type is due to the fact that the new design utilizes its available area more efficiently All the metal types in this line are of equal depth from top to bottom but the majority of the letters (including the seven most frequently used, e t, a i o n and s) cannot occupy that total depth for space must be allowed for what the printer calls the 'ascending letters of the fount so that l, k, b, d and f may have room in which to distinguish themselves from i, x, o, and r and allowance must also be made for the tails of p q y and other descending letters If, however, this allowance is kept to a safe minimum, the gain in apparent size is remarkable

The new design was created only a few years ago by and for the *Times* and the fact that it has been made generally available enables the printing trade to share in the benefits which that newspaper might well have reserved to itself in view of the expense of cutting and recutting the new letter with constant reference not only to the laws of legibility but also to the physical circumstances of printing variations in lighting etc Such tests made it possible for the *British Medical Journal* to do no more than verify, by independent experiment that no other available design would have such particular suitability for its own columns What remained after that primary choice was to prepare trial pages by which different effects of line spacing the differential treatment of headings and subheadings and the effect of different paper surfaces could be compared

Print and the Reader's Mind

There is no page in this week's issue of the *Journal* which can be recognized automatically as a familiar object before it is read But next week's will be recognizable in every typographical respect and through subsequent numbers the successive recognitions will enable the printed pages to achieve that 'transparency which it is the aim of reasoned typographic design to achieve

Hence, when the moment arrives as it will after the publication of less than a month's issues of the *Journal* that the reader notices (as it were) that he has stopped noticing anything between himself and the sense of the words lines, and paragraphs that will be the time for him to compare the new with the old typography It will then be evident that the duty of the *British Medical Journal* to its readers—the dissemination of current medical knowledge—has been assisted by its production in accordance with the findings of modern typographical research

BIBLIOGRAPHICAL REFERENCES

A NOTE FOR CONTRIBUTORS TO THE B M J

Starting with this issue (January 2nd, 1937) the *British Medical Journal* is adopting the Harvard system of giving references to scientific literature and is using the abbreviations of scientific periodicals which are included in the *World List* This system which has been slightly modified, is as follows

References in the Text

1 Numbered references in the text are not used although with an exceptionally long list of references this rule might be relaxed

2 Instead of a ' superior numeral the author's name and the date of the publication are given in brackets

EXAMPLE A

Old style = It has been said[1] that coma in heart disease is rare

Harvard system = It has been said (Jones 1935) that coma in heart disease is rare

EXAMPLE B

Old style = Dale and Dudley[2] isolated acetylcholine from animal tissues

Harvard system = Dale and Dudley (1929) isolated acetylcholine from animal tissues

In other words when the author's name is part of the sentence only the year of the publication referred to is to be in brackets When more than one paper by the same author is published in any one year each paper should be distinguished by a small letter—a b etc—placed after the date—for example (Brown 1935a)

References at End of Paper

1 These references are not numbered with the possible exception of a long list of references

2 Authors names are arranged in alphabetical order

3 The year of publication is given in brackets after the author's name

4 The title of the periodical is printed in italics and abbreviated in accordance with the *World List of Scientific Periodicals*

5 The volume number is printed in Arabic numerals in bold face type this is followed by the first page number of the paper quoted

6 When the title of a book is referred to the name of the publisher the place of publication and number and date of the edition should be given when possible

7 When an author's name is repeated in the list of references a short line represents the repeated name

EXAMPLE

In contrast to these results O Brien (1932) and Yudkin (1933) report that cataracts only occur in rats deprived of vitamin B at an early age and not in older animals while in this country Bourne and Pyke (1935) carefully repeated the work of Day and Langston (1937) and obtained an incidence of cataract of only 31 per cent Bourne and Young (1934) have made a discovery of great importance in showing that in rabbits naphthalene is conjugated with cystine

HEALTH OF THE SCHOOL CHILD

CHIEF MEDICAL OFFICER'S REPORT*

Sir Arthur MacNalty, in his annual report as Chief Medical Officer of the Board of Education for 1935, says that that year was eventful in the study of the nutrition of school children In May a new Advisory Committee on Nutrition was set up, and the League of Nations published two important reports *Nutrition and Public Health*, and *The Physiological Bases of Nutrition* These events increased the already great public interest in the subject, and reinforced the demand that public health should be attuned to the influence of the remarkable recent advances in the science of nutrition The year 1935 was also the first complete year of the Milk Scheme, the largest experiment in supplementary school feeding the world has yet seen It was the first year in which the method of classifying the nutrition of children into four classes by clinical assessment was generally applied in all areas The reports of school medical officers throughout the country do not suggest that the nutrition of school children has deteriorated There may, however, be a question whether the progress has been as satisfactory as might have been, undernourishment almost undoubtedly exists in certain areas where severe depression continued over many years has left its mark

Statistical Returns

The new method by which school medical officers estimate and record malnutrition continues to group children into four classes, but these have been altered to meet the much higher general level of nutrition which now exists compared with the level in 1908 The categories are excellent, normal, slightly subnormal, and bad, and the classification is made on clinical grounds and not on height and weight in relation to age During 1935 the nutrition of 1,687,331 children examined at routine medical inspections was classified on the new basis In 14 6 per cent the nutrition was assessed "excellent", in 74 1 per cent "normal", in 10 6 per cent "slightly subnormal", and in 0 7 per cent "bad" The Chief Medical Officer points out that nutrition means the general well-being of the child, which depends on many other factors besides food—for example, adequate sleep, proper housing, sunlight, fresh air, exercise, and even happiness Therefore it must not be directly inferred that 11 3 per cent of the children are underfed or improperly fed In any unselected school population, however well fed, there will always be about 4 per cent which, from a variety of causes, will appear subnormal in nutrition The 8-year-old children make the poorest showing and the 12-year-olds the best, except for the small group of still older "leavers"

No comparison with previous returns is possible, for the basis of classification is different The contrasted figures may, however, seem to suggest some increase in malnutrition, and the question naturally arises whether this apparent increase is due (1) entirely to the new method of assessment, (2) to a greater attention to nutrition, or (3) to a real increase in subnormal nutrition In London, however, close attention has been paid to the clinical classification of nutrition and the statistics have been drawn up for many years in four categories, so that those of the present and previous years are fairly comparable The report of Sir Frederick Menzies, from which Sir Arthur MacNalty quotes freely, indicates clearly that there has in fact been no deterioration in the children's general nutrition

On the whole the change in the method of assessment has been well received by school medical officers The new method was introduced in the hope of attaining some concept of the state of nutrition of school children in the country as a whole, and of making the returns of the different areas more comparable The Chief Medical Officer thinks it probable that some success has been attained in the first aim, but success in the second is more doubtful He concludes tentatively, after considering all the returns, that comparability is obviously still imperfect but that some improvement has been effected and more will be attained in future The composite picture given by the total returns is probably near the truth, and the returns of the larger areas may be less true Children in London and the South show a higher average level of nutrition than those in the industrial cities of the Midlands, and a higher level still than those in the North of England and South Wales Though great divergencies are seen in the returns from the depressed areas they show a greater incidence of subnormal and bad nutrition than in other parts of the country There seems however, to have been little deterioration, even in these areas

The Milk-in-Schools Scheme

School medical officers all over the country attach great importance to the provision of milk for growing children not only for those suffering from subnormal nutrition but also for normal children whose diet would ordinarily be regarded as satisfactory On the other hand, the scheme seems to leave a certain group of children unprovided for In some rural areas the county medical officer cannot approve the only available supply of milk, and in some small and remote schools it is difficult to find distributors who will supply milk for the allowance available It is however, probable that over 90 per cent of the school population are attending schools where they have an opportunity of buying milk at the reduced price The main problem is therefore not the absence of facilities but the failure of a large proportion of children to take advantage of them

Physical Education

The Chief Medical Officer rightly regards nutrition as his most important problem, for physical training is of little value to an undernourished body After dealing with nutrition, however, he lays great stress on physical training and its co-ordination with mental training—the educative co-ordination of mind and body The national system of education, he says, must ensure that the body is trained to proper condition through physical exercises, gymnastics, organized games, athletics, swimming, and dancing The Board of Education's circular on physical education issued early this year laid down a general policy of health and physical education founded on free physical exercises up to the age of 11 years, and physical exercises and gymnastics for children and young people above that age Rightly conducted these are the best possible foundation for games and athletics Movement, variety, and enjoyment should be their keynote, and they must therefore be in the hands of skilled teachers Gymnastics, owing to lack of suitable accommodation and equipment, has hitherto played only a small part, and teachers of gymnastics have therefore not been available in large numbers This need will be provided through advanced courses in the normal training colleges, through an increase in the number of courses providing at least a year's specialized training through intensive courses of shorter duration, and through short courses of various kinds The Board also contemplates an increase in the provision of gymnasia and equipment and of suitable playgrounds and playing fields It regards physical education as an essential part of education and not merely as one more subject to be squeezed into or out of the curriculum

The movement for a more thorough organization of physical education has received further impetus from the publication of the report of the Physical Education Committee of the B M A Sir Arthur MacNalty describes this report as a comprehensive and valuable survey of the whole field of physical education, which powerfully re-

* The Health of the School Child Annual Report of the Chief Medical Officer of the Board of Education for the Year 1935 London H M Stationery Office (2s 6d net)

of thyrotoxicosis knew that in some of them the blood pressure remained within normal limits, in others the systolic pressure alone was raised, while in a smaller number both the systolic and the diastolic pressures were raised When this last condition was found it had probably occurred independently of the goitre The condition must be taken into account when giving a prognosis

On cardiac failure not due to thyrotoxicosis the lecturer spoke with reserve When the extent of cardiac function following thyroidectomy was seen it opened up the possibility of relief in hopelessly incurable congestive heart failure by relieving the heart of the driving force of the thyroid even when the failure was not caused by thyrotoxicosis The selection of cases was in the sphere of the cardiologist Here the surgeon was a carpenter only

Glycosuria

Glycosuria was the second most common complication of toxic goitre This was more particularly a matter for physicians and it was not his business to differentiate between true diabetes and the less serious type of glycosuria He did not know what proportion of the population had a low carbohydrate threshold, but toxic goitre was one of the factors that disturbed the narrow margin of safety The severity of the complications and the length of time they had been present affected the prognosis

One patient aged 46 whom he saw in 1933 had developed the disease in 1918 after her husband had been killed in the war X ray treatment was given in 1922 In 1932 she was stated by a physician to be almost in coma Fibrillation was then present also The daily dose of insulin required was then 90 units and she was kept in bed for twelve months Operation was performed fifteen years after the onset of the disease Following operation the daily dose of insulin could be reduced to 20 units and she lived an active life with some limitation

It all came down to the need for adequate supervision Some of these patients were very fond of food unsuitable for them, and were not willing to exercise self discipline We have some skill in curing the disease, but little in restraining the appetites of our patients '

Another aspect of this subject was interesting From his records he found that three patients had developed diabetes subsequently to operation, although the urine after operation had been sugar-free and they had never had diabetes previously In one of them the disease appeared three years in another four years, and the third six years after the operation

Disturbances of the Central Nervous System

Disturbances of the central nervous system might go on to such an extent that the mentality became unbalanced and cases of this kind were a greater anxiety than those arising in any other complication of the disease With all the others the risks could be judged and management arranged accordingly but with the central nervous system there were all too few guiding indications and none of them sure If success was achieved the transformation was almost miraculous but this occurred too seldom for any general rule to be laid down In this condition operation was not to be undertaken or contemplated without the advice of a psychiatrist as well as the physician in charge it was altogether beyond the ability of the surgeon to decide among the different types of mental derangement

A patient aged 66 had been removed from a general hospital to a mental hospital where she had been an inmate for some months when he saw her She had been a normal woman until the onset of thyrotoxic symptoms she became quite well mentally following operation

A patient aged 54 was ill with toxic goitre but was reasonably well controlled She afterwards became alarmingly ill delirious and lost 12 lb in sixteen days fibrillation had been present all along Some time later he ligated the superior arteries seventeen days afterwards he ligated the inferior arteries and sixteen days after that performed resection About four days after the resection a lucid interval occurred On the following day it reappeared and lasted longer but delirium again returned Ultimately however her mind cleared and she became normal and had been clear and cheerful ever since

There was another side to the picture A woman aged 57 had had a goitre for the greater part of her life, but the symptoms were regarded as comparatively mild, notwithstanding that her heart had fibrillated intermittently for years She had been on several occasions an inmate of a mental home With the fibrillation present and the raised pulse rate there was no doubt of the thyrotoxicosis After operation the heart became slower and the rhythm regular But after some months the mind gave way again He had found the greatest difficulty in patients of the *forme fruste* type where the thyroid was undoubtedly involved but the picture was incomplete and where other members of the family showed mental instability as well as the patient herself Altogether he had had forty five patients who were definitely mental most of whom had been in some mental home, and thirty nine of these were now normal

Exophthalmos, Loss of Weight, and "Masked Hyperthyroidism"

The cause of exophthalmos had given rise to much speculation The extent to which it disappeared was probably dependent on the length of time it had previously been present long continued spasm leading to organic change Exophthalmos could be such a disfigurement that unless improvement by other means was definite operation should not be delayed

As for loss of weight, generally on rest and treatment the loss was stayed and some weight put on There were some patients of this type who failed to show any response to iodine but not all the patients with this disease lost weight Evidently the knowledge of thyroid secretion and metabolic factors was far from complete

The term masked hyperthyroidism had come into use and required examination The adjective was useful, but Sir Thomas Dunhill doubted the wisdom of using it It was employed in four conditions (1) when there was no enlargement of the thyroid gland in the neck but a substernal or intrathoracic goitre alone was present, (2) when enlargement of the gland in the neck was not detected by the medical attendant or physician even when obvious to the surgeon, (3) when an enlarged gland existed together with heart failure but the causal relationship had been ignored (he would not call this ' masked hyperthyroidism, ' it is the practitioners who are masked eyes and brain too) and (4) where there was actually no enlargement of the gland He remained unconvinced that thyrotoxicosis occurred in association with a thyroid gland which was normal in size or structure

Aetiology and Treatment

After touching on the problem of the *forme fruste* type and of neuro circulatory asthenia the lecturer said that a discussion on aetiology did not come within the scope of his lectures The enthusiasm with which he had urged operation in suitable cases was equalled by his fear lest a good operation might do a grave disservice when used for unsuitable cases

The medical treatment of toxic goitre required no words from him To say that iodine should never be administered except as a preparation for operation was to withhold a drug that could turn the scale in many patients but at the same time their medical friends should be fair with the surgeon for it had repeatedly happened that when a patient had been severely ill rest in bed and iodine had wrought a dramatic change but the disease pursued its inevitable course and the patient ultimately died On the other hand some physicians had become so surgically minded in their outlook that it seemed to be left to the surgeon to point out what a field there was for the general

players The root of the present discontent among the public seemed to be that medical students were never given a chance systematically to study man as a whole Beyond their scientific knowledge of man lay an incom pletely explored area in which important things hap pened without discoverable cause, but they had become so sure that science was the only door to knowledge that they tended to ignore the older ways of approach If they could succeed in reawakening the sense of wonder which in the days of the Renaissance gave birth to science itself they could make fresh starts along new lines The brilliant achievement of science had won prizes by disci plined curiosity, but that must not obscure the fact that to day science was running into blind alleys from which it could only emerge by escaping from direct touch with human understanding A vote of thanks was proposed by Professor R W Johnstone and seconded by Dr R F Dawson in which the former reminded the members that Sir Auckland Geddes as a president of the society had given a dissertation some thirty years ago on the subject of Waste, and that he had later been a professor of anatomy in McGill University director of recruiting at the War Office Minister of National Service Minister of Reconstruction, and British Ambassador to the United States

Central Midwives Board

At a meeting of the Central Midwives Board for Scot land, held for the election of office bearers with Dr R C Buist in the chair, Professor R W Johnstone, CBE, MD FRCSEd FCOG, of Edinburgh was unani mously elected chairman and Professor James Hendry, BSc MB FCOG, of Glasgow, deputy chairman The meeting appointed committees and examiners for the ensuing year

Correspondence

A Bureau of Geographical Medicine

SIR —The letters of Dr F C Eve (*Journal* October 24, 1936, p 840) and Professor Walter P Kennedy (November 14, 1936 p 1002) prompt me to ask to be allowed to bring to the notice of your readers the existence of an organization designed to meet, to a certain extent at any rate the needs they have so clearly expressed for a central bureau Those of us working among non European races rapidly become aware of the fact that physiological con stants based on observations of a small sample of human beings are not necessarily the average constants of any other or all other races At its meeting held in Zurich in 1934 the International Federation of Eugenic Organiza tions discussed this problem, and the result was the forma tion of a Committee on Anthropological Physiology The aims of this committee, of which I am chairman are (1) to stimulate the investigation of physiological constants among the various races of mankind, (2) to make contact with the workers on this subject in the different parts of the world in order that interchange of ideas and results may be facilitated, (3) to ensure that where possible, similar methods may be used so that comparative data may be of greater value, and (4) to provide at the meet ings of the organization facilities for investigators to meet and discuss their problems Owing to the nature of this committee it is doubtful whether as a whole it will ever meet and hence its numbers are not limited rather it is advisable to have it as large as possible and have on it a representative of every country where physiological standards are being investigated The main duty of each member towards the committee is to keep the chairman informed from time to time of the work being done in his particular part of the globe This information is then circulated to all other members by the chairman In order that investigators may know who already repre sents the various countries on this committee, and also in the hope that workers not thus represented may be induced to volunteer to act as members, I should like to give the personnel of the committee as it now stands

America—Professor L Snyder Columbus Ohio Professor Benedict, Boston Mass
China—Dr H G Earle Henry Lester Institute Shanghai
India—Lieut Colonel Bhatia Grant Medical College Bombay
Japan—Professor Sen Nagai Imperial University Tokyo
Netherlands Indies—Professor Radsma Batavia
New South Wales—Professor Whitridge Davies Sydney
South Australia—Professor Clelland Adelaide
Denmark—Dr Taga Kemp Copenhagen

Information concerning the work of this committee in particular and the organization in general may be ob tained from the honorary secretary, Mrs C B S Hodson, 443, Fulham Road, London, S W 10—I am, etc,

The University Hong Kong Feb 4 LINDSAY RIDE

Specific Antitoxins for Gonococcal and Meningococcal Infections

SIR —May I be allowed to discuss several points and state facts concerning matters raised by your annotator in the *Journal* of February 13 and of February 27 in regard to my paper on gonococcus antitoxin published on February 13 (p 321) The annotation stated that the starting point of the work which had led to the adoption of this treatment was an attempt by Corbus to prepare a Besredka antivirus Had this been so I should have acknowledged Corbus Without decrying his work may I state the facts more explicitly

For many years all the known methods of treatment, their possibilities and what we thought might be fruitful avenues of research had been discussed between Professor Edward Mellanby and myself Over a period of twenty years innumerable experiments achieved little until on February 2, 1934 Mellanby sent me a letter from the office of the Medical Research Council stating that he was very anxious for me to meet Dr Mervyn Gordon of St Bartholomew s Hospital to discuss the possibility of testing some antitoxic preparations in gonorrhoea, as he [Gordon] had much experience in the problems of the meningococcus which might be extended to the gono coccus Immediately communicating with Gordon I received a letter three days later in which he expressed the opinion that 'the problem of immunity as regards the gonococcus is not so vastly different from the same problem in relation to the meningococcus Active co operation followed and I enjoyed the inestimable advan tage of Gordon s mature experience and judgement

I feel Sir that your annotator hardly does justice to the part played by Mellanby and Gordon in this work, although I tried to do so in my paper May I record again that the starting point of the work was our recog nition of the close similarity of the meningococcus to the gonococcus and Gordon s previous researches in con nexion with meningococcal meningitis which resulted in such brilliant clinical results

Again, as a practical clinician I am not too concerned with your annotator s academic discussion and the inter pretation placed on tests by bacteriologists *to the complete exclusion of the clinical results* Apart from my own observations the clinical evidence submitted by Dr Stanley

practitioner, who had the opportunity of seeing the first signs of temperamental change in a young patient whom perhaps he had helped to bring into the world

As for radiation, the epithelium of toxic goitre was radio-sensitive, and he had seen good results maintained for some years in young patients and patients in the early stage of the disease On the other hand, he had had 166 patients sent for operation after they had been given a full course or courses of x-ray treatment early in their lives, and of this number twenty-six had established fibrillation at the time they came for operation

Lecture II ended with a few words on anaesthesia Sir Thomas Dunhill's practice was to have a little premedication, with avertin following that, and under avertin the patient never knew she had left her bed The neck could be injected early with local anaesthetic solution, and afterwards a little nitrous oxide and oxygen was grateful and comforting for operator and patient

(To be concluded)

COMBINED ENGLISH UNIVERSITIES SEAT

SIR HENRY BRACKENBURY'S ELECTORAL ADDRESS

The following is the text of the address to the electors of the Universities of Durham, Manchester, Liverpool, Leeds, Sheffield, Birmingham, Bristol, and Reading by Sir Henry Brackenbury, M D , LL D , vice-president of the Association of Education Committees and Vice-President of the British Medical Association

I have been invited to become a candidate for the representation of the Combined English Universities in the House of Commons, as one who is completely independent of all organized political parties I believe that such a position is the most suitable one for a university representative, and I have for some years past not been a member of any such party I am a firm believer in the national usefulness of university representation, but this cannot be justified or long continued if it is regarded as a refuge for parliamentarians without a seat or as a mere recruiting ground for those who are chosen by, and owe their main allegiance to, purely party political organizations It must be remembered that the vote of a graduate, as such is a second vote, and that he has an opportunity of giving his first vote on party grounds if he wishes to do so

As a citizen I am not without views as to a number of political questions, but I have accepted candidature at this election because I believe that I could contribute something useful to the consideration of progress and reform in the fields of education health, and what is called broadly social welfare I am fully aware of the main problems which these fields present, and have had a somewhat wide experience of the organization and administration necessary for their effective solution

Motherhood and Childhood

The main hope for the future of this country is the cultivation of childhood and the full development of all its immense potentialities The chief care of the nation should be to help and encourage motherhood and to make it as safe as possible, and to secure for children, even from the pre natal stage up to full adolescence, such a physical and mental environment as will permit of the development of a complete and many sided personality I appreciate the efforts which the present Government have made and are still making to these ends, but bolder, more continuous, and more co ordinated efforts are required A fuller and integrated scheme for a national maternity service is immediately necessary

Education and the Teacher

Nursery and open air schools should be further encouraged, and many of the older school buildings should be radically altered or replaced The provision of playing fields, gymnasia, and swimming baths should be facilitated Restrictive regulations on secondary school buildings, made when economy was urgently required, should be rescinded, in the planning of new schools, both elementary and secondary due regard should be paid to the provision of suitable and sufficient dining hall and kitchen accommodation A larger proportion of specially qualified, trained, skilled teachers is required in most schools, not least in those for infants and junior scholars and for retarded children The coming considerable fall in the number of children of school age should not be used for an immediate reduction in teaching staff, but rather as an opportunity for securing smaller classes and a higher proportion of teachers to children It should be made possible for teachers to take their due share in public life Some of these things cannot be effected at once or very quickly but they should be the subject of definite plans to be accomplished within a relatively brief period

Nutrition

The question of nutrition is even more urgent, and can if there is the will, be more easily and rapidly dealt with Considered broadly there is room for anxiety but not for alarm There are no exact criteria by which degrees of nutrition can be measured and therefore individual assessments may vary, but according to recent statistics the percentages of the elementary school population placed in each of the four categories officially recognized are excellent 14 6 normal 74 1, slightly subnormal 10 6, bad 0 7 It should be remembered, however, that such arithmetical statements may be a veil which covers diversities of great importance, and the community ought not to rest satisfied so long as there are any under nourished children in the country Factors concerned with nutrition are many Food is doubtless the most important, but sleep, atmosphere, sun, exercise, and psychological conditions of fear, distress, and unhappiness are others All these require attention, but much could, and should be at once accomplished by a wide and wise extension of the scheme for milk in schools, by a better method of providing and serving for midday meals in many schools, and by the continuation, where necessary, of these provisions over holiday periods

Physical Training

The interrelationship between physical training and both nutrition and mental training is so close that they cannot properly be separated I am in full sympathy with the proposals of the present Government in this regard I was a member of the Executive Committee of the Central Council of Recreative Physical Training and of the Special Committees of the British Medical Association on Nutrition and on Physical Education, which have had so profound an effect in guiding public opinion and formulating policy on these questions I hope that experience gained in these investigations and surveys might prove useful in the designing of practical measures for development

Care of Health, Mental and Physical

The gaps still remaining in the continuity of care for children and young persons should be filled, and the permitted hours of labour of those who have entered industry shortened The dependants of persons insured under the National Health Insurance Acts should be included in that health system, and some needed extensions and improvements of that service should be effected Indeed, the time is ripe for the initiation of a comprehensive general medical service for the nation based upon the prevention of disease the promotion of positive health, and the provision of skilled medical care and attention, both general and specialist for those who are ill Such a scheme should be established after full consultation with the medical profession The need for the care of mental health, especially for those disturbed conditions of fear, anxiety, obsession and the like both in children and in adults which cause about one third of the incapacitating illness of the country is quite as great as that for attention to physique and to bodily ills This has not received a sufficient degree of national attention

Banks in the *Journal* of February 20 (p 415) has provided a complete answer twenty-four patients out of twenty-five recovered from an infection, the mortality rate of which, before Gordon's war researches, was extremely high The close similarity of the organisms and Banks's clinical results support the view that meningococcus antitoxin (Ferry) contains antitoxic properties, and my results seem to indicate that the same applies to gonococcus antitoxin Whether these sera are endotoxic or exotoxic seems to me an academic question which can be decided by further investigation in the laboratory, especially as both Ferry and Gordon state that the meningococcus toxin is remarkably thermostabile

While in agreement with your annotator that facilities for preparing and testing sera should be available to research workers in this country it is to be regretted that such was not the case Furthermore, so far as I am aware, Dr Ferry was the only investigator who had ever produced a soluble toxin with which to immunize the horses Had it not been for the courtesy of Parke, Davis and Co in complying with my request this work could not have been accomplished My investigation was accelerated by the fact that Ferry some time before had actually produced an experimental gonococcus antitoxin, and this first batch was the material which I employed in my early cases

The question asked by one of your correspondents as to whether adjuvant treatment was employed can be readily answered Some of the cases quoted had no other treatment, others were treated along routine lines After all, one does not rely on antitoxin in treating a case of diphtheria to the exclusion of throat sprays, cardiac stimulants, and skilled nursing—I am, etc,

London, W 1, March 1 T ANWYL-DAVIES

Oxygen Administration

SIR,—Recently a box mask was introduced for cheap and efficient administration of oxygen The mask described previously was for adults (14 years or older) Inquiries having been made as to the application of the mask to younger patients, details are given in the table below for the correct dimensions of the mask for various ages, and also the approximate rates for flow of oxygen for ordinary conditions of pneumonic anoxaemia Higher rates may be tried if necessary These rates have been worked out from the tidal air for various ages The mask may be cut from a suitable light cardboard box and a light rubber tube (internal diameter 5 mm) in about ten minutes, following closely the details given in previous communications (*British Medical Journal*, 1936, **1**, 1245, and *Lancet* 1937, **1**, 82)

Dimensions of Mask and Rates of Oxygen Flow for Various Ages

Age	Weight in Kilos	Tidal Air	Dimensions of Mask				Rate of Oxygen Flow Litres Per Minute
			Length	Breadth	Depth	Volume	
0 6 months	3 7 7	c cm 48	cm 6	cm 5	cm 3 5	c cm 105	0 7-1
6 12 months	7 7 12	85-129	8	6	4	192	1-2
3-7 years	14 3 19	124 221	12	9	4	432	2-3
8-14 years	22 29	221 395	13	10	5	650	3 4
14 years and over (adult)	60 70	440 550	15	12	7	1260	5-6

The efficiency of the mask depends on the inlet tube being turned back on itself and placed in the correct position inside the mask, so that the incoming oxygen strikes the middle of the top of the inside of the mask The opening at the back of the mask to accommodate the nose, mouth, and part of the chin must be cut to suit the size of the patient's face The mask must be connected with a "bobbin" flowmeter and automatic regulator for the oxygen cylinder, as shown in the papers already referred to

The masks may also be made of aluminium or a wire frame with a linen or silk covering (makers, Siebe Gorman and Co, London, S E 1)—I am, etc,

London, N W 3, Feb 25 J ARGYLL CAMPBELL

Angioneurotic Oedema of the Tongue

SIR,—The recent references to angioneurotic oedema (*Journal*, January 30, p 244, February 6, p 299) prompt me to record a similar case

About nine months ago my patient woke with a swelling of his tongue, which he thought was due to a sting as he slept with his mouth open In two hours his tongue was so large that he could not speak or swallow his saliva About one and a half hours later the swelling began to subside and in six hours the tongue was normal

On January 2 this year he woke with pain in his bladder and Dr Langwill was consulted He was found to be suffering from oxaluria which rapidly subsided under treatment

On January 5 he woke with swelling of his tongue again, which rapidly became worse The jaws were forced widely open and his tongue protruded, so that he could neither speak nor swallow, and saliva dribbled from the corners of his mouth He had the feeling of impending suffocation Dr Langwill was called, and gave him 10 minims of adrenaline chloride, but the swelling steadily increased and a brawniness appeared below the chin I was called in with a view to opening the trachea if necessary, but by the time I arrived the swelling had begun to diminish He was given another dose of adrenaline chloride and arrangements were made with a near-by nursing home in case of a recrudescence At the nursing home preparations were made for a laryngotomy if it should become necessary

The swelling gradually disappeared and had quite gone by 6 p m The patient had eaten a raw perch the day before and had also had bladder trouble recently—two factors which curiously enough, were mentioned by Dr Hughes (*Journal* January 16, p 121)

A patient who has a respiratory obstruction almost invariably becomes extremely anxious, this nervousness is often communicated to the doctor either by the patient or his friends, who want something done to relieve the possible risk of suffocation, and tracheotomy is almost always considered and I have no doubt is in some cases done Anyone who has studied the sudden swelling of the tongue, whether from inflammation trauma, stings, or other causes, knows that tracheotomy should be avoided at all costs Incisions into the tongue will as a rule relieve all symptoms, especially if the tongue be squeezed as one would squeeze a sponge, after making them But in angioneurotic oedema I think a far preferable operation is a laryngotomy This is very simple, produces no haemorrhage, and is a purely temporary measure, causing the least possible inconvenience It has also the advantage over tongue incisions that should the angioneurotic oedema spread to the larynx there is no danger to life I have never heard of suffocation from angioneurotic oedema spreading to the larynx, but there is no reason why it should not do so—I am, etc,

London, W 1, Feb 23 DUNCAN C L FITZWILLIAMS

Research

Biological psychological and medical research into many aspects of maternity mentality and educational methods as well as research into various branches of technology and agriculture should be more fully aided by the State preferably under the auspices of the universities of the country

Medical Education

If it be true that a well educated and properly used medical profession is probably the best safeguard of the public health the subject of medical education is of great importance both to that profession and to the public I have been prominently concerned with more than one of the recent inquiries which have been made into this matter and while I am convinced that most of the changes in the newly prescribed curriculum will tend to the improvement of what was already good changes in medical science social needs and pedagogic methods are so rapid and significant that continued efforts are required to keep medical education fully adapted to the needs of the community The interrelationship between the study of the preliminary sciences and general subjects leading up to the medical course and the work of the secondary and public schools is so intimate that there ought to be far closer consultation and co operation between those responsible for these respective fields of study This is true also in some degree in reference to engineering and to the application of science to industry

Special Areas

All these things are matters of nation wide interest some of them are aggravated in the special or necessitous areas More prompt and vigorous methods than have yet been used are required to meet the adverse conditions of these areas, and these should be mainly in the direction of industrial revival and establishment in their neighbourhood rather than of dispersal of their population

Peace and the League of Nations

Peace and good neighbourliness among nations are essential if world disaster is to be avoided and I hold that they can be successfully pursued not only through diplomatic channels and by the lowering of economic and trade barriers but by firm reliance on the League of Nations The successes of the League in many spheres even the political, have been far greater than is commonly supposed Its major failures as in the cases of Japan and Italy have not demonstrated its futility but have rather shown the way to greater effectiveness by some modification of methods

Defence of Democracy

The defence both material and cultural of democracy has once more to be undertaken I am prepared to support all such measures as are shown to be essential for such defence and for the safety of this country and of the British Commonwealth of Nations which are its chief exemplars but the best justification and most abiding support for democracy will be found in assiduous attention to the health education and material and spiritual well being and freedom of the people

The second Conference on Industrial Physics will be held under the auspices of the Institute of Physics in Birmingham from March 18 to 20 The subject of the conference is Optical Devices in Research and Industry An exhibition of instruments, apparatus and books cognate to this subject is being arranged and will be held in the physics laboratories of the University of Birmingham A section will be devoted to popular applications of optical devices, including photocells The presidential address on Spectroscopy in Industry ' will be delivered by Professor A Fowler, D Sc, F R S Visits to local works and research laboratories will be included in the programme There is no conference fee and membership is open to all interested Particulars may be obtained from the secretary, Institute of Physics, 1, Lowther Gardens, Exhibition Road, S W 7

Reports of Societies

AETIOLOGY AND DIAGNOSIS OF JAUNDICE

At a meeting of the Medical Society of London on February 22 Sir WILLIAM WILLCOX occupying the chair a discussion took place on the aetiology and diagnosis of jaundice

Dr C E LAKIN in opening first made a reference to blackwater fever This disease might occur in those who had suffered from subtertian malignant malaria and from whom the infection had not been completely eradicated The actual attack might be precipitated by cold overexertion, or quinine Haemoglobin was liberated from the corpuscles so rapidly and in such large quantity that the cells of the reticulo endothelial system were overwhelmed, and the urine was found to contain haemoglobin and the skin was deeply pigmented Haemolytic pigmentation of the skin was also seen sometimes in cases in which transfusion had been carried out with incompatible blood There did not exist any sharp line of demarcation between the haemolytic pigmentation of blackwater fever and incompatible blood transfusion on one hand and on the other so called haemolytic jaundice Examples of haemolytic jaundice were those of pernicious anaemia, acholuric jaundice, malaria, Orova fever, poisoning by potassium chlorate, sulphonal or some snake poisons, and some cases of septicaemia When haemoglobinuria occurred in the course of septicaemia the prognosis was thereby rendered more grave

Toxic or hepatogenous jaundice included many conditions of diverse aetiology, a main feature being a retrograde change affecting the parenchymatous cells of the liver so that they could no longer transmit the haemolytic products to the bile capillaries In cases of toxic jaundice there was usually some splenic enlargement too When widespread destruction existed the whole liver function was seriously impaired, and the fatal issue was preceded by pyrexia, persistent vomiting haemorrhages, delirium, and coma In obstructive jaundice there was a mechanical interference with the passage of bile from liver to intestine and the digestion and absorption of fat was so defective that the total fat might form 50 per cent of the stools Constipation was the rule in this type but occasionally diarrhoea occurred, ascribable to fermentative changes in the intestinal contents For determining whether a patient was truly jaundiced only bright daylight should be used for the examination In the obstructive form the conjunctiva was yellow but not in haemolytic jaundice

Differentiation of Type of Jaundice

Having decided that a case was one of jaundice the differentiation as to type was based on information yielded by the following (*a*) a careful history including details of family illnesses (*b*) clinical examination of the patient (*c*) x ray and perhaps a cholecystographic examination (*d*) a laboratory examination of blood urine and stools including in this examination perhaps material obtained by duodenal intubation Sudden jaundice in a healthy patient suggested obstruction of the common bile duct by gall stone a slow onset of jaundice gradually becoming more intense probably pointed to a new growth in the duct or pressure upon it from without In a young adult painless commencement of jaundice preceded by evidence of gastro duodenal catarrh suggested catarrhal jaundice the indication was not so clear in those of maturer age When the jaundice was preceded by loss of weight there might be present pancreatic disease or malignant disease of the alimentary tract A clue might be gained by inquiring into the kind of occupation followed by the patient If the liver was palpable it should be determined if possible whether its surface was smooth or hob-

Cancer of the Breast

SIR,—We feel that the letter of Dr W Griffiths (*Journal* February 20, p 416) is apt to be misleading to those inexperienced in radiation therapy In advocating contact x ray therapy we gather that he is referring solely to the treatment of cancer of the breast

He says that the sole virtue of radium lies in our ability to place it in contact, or nearly so, with the growth This applies perhaps to interstitial therapy, where the radium is actually introduced into the tissues in the immediate vicinity of the growth and so arranged that adequate cross fire is obtained, but it certainly does not apply to surface radium applications Ten years ago we were treating rodent ulcer and squamous cell carcinoma of the skin with radium tubes in contact and though early results were good, recurrence in the less superficial lesions was fairly common During the past seven years the increased depth dose obtained by irradiating at a distance of 1 cm (*or more in deeply infiltrating lesions*) has given uniformly excellent results from the points of view of primary healing and freedom from recurrence Incidentally intensive doses of x rays (100 kV with a 0·5 mm aluminium filter at a distance of ten inches), administered over a period of a week or ten days, has given in the few cases in which we have tried it equally good results In the treatment of such localized superficial conditions contact x ray therapy may give comparable results

To return to the subject of cancer of the breast The types of case with which the radiologist is called upon to deal are so varied that no single technique of irradiation can be universally applicable Interstitial radium high-voltage x rays with heavy filtration, and lower voltage x rays with less filtration all have their place It seems to us that contact x ray therapy, even with the increased kilovoltage which Dr Griffiths suggests must have a very limited scope in the treatment of breast cancer Isolated skin nodules certainly might be successfully dealt with, but the rapid falling off of intensity at the edge of any but small skin fields inseparable from this 'close up' therapy would make it difficult to apply in those cases of extensive nodular skin recurrence, sometimes confluent and ulcerating which are so commonly encountered Assuming the desirability of lower voltage, why not an adequate distance? In dealing with the primary inoperable growth glandular or bony metastases, the inadequate depth dose obtainable with contact therapy must surely rule it out—We are, etc,

Intraperitoneal Haemorrhage from a Graafian Follicle

SIR—The recent correspondence in your columns (*Journal* February 13, p 362) prompts me to mention two further haemorrhages of ovarian origin in patients who were admitted into the Middlesex Hospital during the last two years, and whom Mr Gordon Taylor kindly allowed me to treat By his courtesy I am enabled to put their cases on record I believe incidentally that Gordon Taylor was among the first to draw attention to this type of ovarian haemorrhage in a paper published in the *Archives of the Middlesex Hospital* in 1908 (Clinical Series, No 4 p 36)

His patient was an unmarried woman of 26 Two days before she was brought to hospital she had complained of severe pain all over the abdomen which had subsided but recurred the following evening and caused her to faint several times On reaching hospital her condition was so grave that the doctor who had brought her thought her to be already dead and there was some debate whether she should be taken to the mortuary or rushed to the operating theatre The latter was decided upon and after an intravenous saline had been given the abdomen was hastily opened An enormous quantity of fluid blood and clot was found and blood was seen to escape from a small rent in the left ovary A ruptured ectopic pregnancy was diagnosed and the left tube and ovary were removed Pathologically however there was found to be a ragged cavity in the ovary a quarter of an inch in diameter which contained blood clot The cyst was lined by vascular lutein tissue

She made an uneventful recovery but was readmitted four months later with right sided abdominal pain which was found at laparotomy to be due to an enlarged cystic right ovary, one cyst being two inches in diameter and filled with recent blood clot The two cases seen recently were as follows

Case 1—A single woman aged 35 admitted on June 30 1935 had complained of pain in the right iliac fossa on the previous day This had gradually spread towards the epigastrium Her abdomen was soft but she was tender in the right iliac fossa just below and to the right of the umbilicus her temperature was 100 F pulse rate 96 Her menstrual period had begun three days previously She had suffered from dysmenorrhoea for some time past On opening the abdomen through a right paramedian incision a large quantity of fluid blood and two handfuls of clot were found Blood was escaping from the right ovary which was removed together with the tube under the impression that we were dealing with a case of ruptured ectopic pregnancy When the specimen was examined afterwards it was found that the blood was coming from a haemorrhagic cyst in the ovary On section the cyst proved to be a corpus luteum

Case 2—A single woman aged 24 was admitted on May 20 1936 She had had an acute attack of general abdominal pain on the previous evening She was tender in the right iliac fossa but not rigid her temperature was 98·4 F pulse rate 80 She had suffered from dysmenorrhoea and her next period was due in a few days time On opening the abdomen a large quantity of liquid blood and a handful of clot were removed The bleeding came from a ruptured cyst three quarters of an inch in diameter which was situated in the ovary The cyst was excised and the rent in the ovary sutured On section the cyst was lined by lutein cells

Neither of these cases was as dramatic as the one described by Gordon Taylor There was no evidence clinically of severe haemorrhage when they were brought to hospital, and both patients were operated on as cases of acute appendicitis In both cases the haemorrhage was from a lutein cyst and not from a Graafian follicle and on looking at random through some of the large number of reported cases I have found the same observation recorded wherever the ovary or cyst was examined histologically Mr Porter in a recent letter says On section the ovary showed a normal Graafian follicle with no suggestion of decidual cells or anything suggestive of an ovarian pregnancy He does not state whether lutein tissue was present

In reporting these cases my object is not to draw attention to a rare condition but rather to suggest that it is one which occurs not infrequently and deserves better recognition in surgical and gynaecological textbooks as a cause of acute pain in the right iliac fossa When the ruptured cyst is on the right side the differential diagnosis from appendicitis is difficult but it should be strongly suspected in the following circumstances

1 When the patient has suffered from dysmenorrhoea and the attack of pain which brings her to hospital is similar in character although more severe

nailed," and whether its bosses were umbilicated If a liver was congested or hepatitis was present the organ would be tender Efforts should also be made to find out whether the gall-bladder was enlarged The supra-clavicular fossa should be examined for any enlarged glands Investigation of the heart should not be omitted, note being made of its size and any abnormal murmurs It was noticed that in late stages of cirrhosis of the liver the first sound of the heart was of defective tone and frequently the rhythm was of tick-tack character When liver abscess was suspected the condition of the right base of the lung should be ascertained and a rectal examination should never be omitted in a case which presented difficulty Bilirubin in the urine could be tested for by the iodine test or by the nitric acid test

In obstructive jaundice the stools were putty-like, bile pigment was present in the urine, and the jaundice was more likely to be intense in these cases than in the haemolytic or the toxic groups In the toxic form it was usual for the patient to be seriously ill yet it did not follow that the jaundice would be very intense

Investigation of cases of haemolytic jaundice should include a complete blood count, fragility tests, and a determination of the mean corpuscular volume, a count of reticulocytes and blood platelets, and the Wassermann test

Laboratory Tests in Jaundice

Dr GEOFFREY HARRISON (pathological department, St Bartholomew's) spoke of laboratory tests in cases of jaundice He said that bilirubin came third in numerical frequency—namely, after sugar and urea The main chemical value of the van den Bergh test was to show the presence or absence of hyperbilirubinaemia when the patient had a slight yellow tint In established cases its value was to enable one to follow the progressive changes in the concentration of the pigment in serum A direct van den Bergh positive meant the presence of mechanical obstruction, but he thought the results of the direct test could not be properly interpreted until more was known of the chemistry of bilirubin and of the van den Bergh test

He thought it would be agreed that the usual chemical tests for bilirubin in urine were not sensitive enough the nitric acid and iodine ring tests were often negative when the jaundice was slight A more sensitive test was an application of Fouchet's test to a barium precipitate from urine, that also depended on the oxidation of bilirubin to green biliverdin and blue cholecyanin It did not give positive reactions in health, nor with pigments other than bilirubin The investigation of the faeces should include a search for stercobilin, not for bilirubin With regard to serum phosphatase, this was an enzyme which hydrolysed phosphate esters to liberate inorganic phosphate It was widely distributed in the tissues, the greatest concentration occurring in bone, kidney, intestinal mucosa, liver, and red cells In active bone disease and in obstructive jaundice the plasma phosphatase was increased

The PRESIDENT referred to his toxicological work and to his war experiences with fatal cases of poisoning by the 'dope" used for aeroplanes, and fatal cases following atophan, luminal, plasmoquine, acriflavine, and avertin Trichlorethane was used largely in dry cleaning, and was very poisonous, while carbon tetrachloride produced atrophy of the liver One of the main purposes of the liver was as a toxiphylactic agent In toxic jaundice the key to the situation was the liver cell Some people tolerated the large quantities of alcohol they were in the habit of taking because Nature provided fourteen times as much liver efficiency as was needed for ordinary requirements

Dr P H MANSON-BAHR said that anyone who shed fresh light on the cause of blackwater fever would do more to explain paroxysmal haemoglobinuria and acholuric jaundice than in any other way In the former the quinine taken had much to do with the paroxysms Since the advent of atebrin, which killed the subtertian parasite blackwater fever as a catastrophe in this country had practically died out One means of curing that disease was by giving large quantities of fluid He expected to see plasmoquine and carbon tetrachloride taken off the black list of drugs The latter might cause toxic jaundice, as did chloroform, but it would be wrong to ban it on that account and the former had never, to his knowledge caused jaundice Dr Lakin had mentioned amoebic hepatitis and amoebic dysentery as causes of jaundice, but amoebic abscess was a condition that was not associated with jaundice

---

DANGERS OF INFECTED MILK

At a meeting of the Section of Medicine of the Royal Society of Medicine on February 23 with Sir CHARLTON BRISCOE in the chair the subject of discussion was milk as a factor in the cause of disease

Infection of the Cow

Dr W G SAVAGE (medical officer of health, Somerset), in opening divided the subject into two groups—namely, human infections associated with infection of the cow, and diseases spread through human infection of milk Dealing first with tuberculosis, he referred to an inquiry which he had made in 1931 the result of which was to suggest that during that year the deaths due to bovine tuberculosis in this country numbered 1 731 He believed that out of an anxiety not to overstate the case the figure was really an underestimate Recent years had shown that the proportion of pulmonary tuberculosis of bovine origin might be considerably higher than the earlier figures suggested He thought the conclusions of the Peoples League of Health Committee might be accepted as a minimum statement that in England and Wales about 6 per cent of all deaths from tuberculosis were caused by the bovine type of bacillus About 4 000 fresh cases of bovine infection developed each year The proportion of cows suffering from tuberculosis of the udder was about 0 2 per cent The proportion of raw milk containing living tubercle bacilli varied widely in different parts of the country but a fair average was 5 or 6 per cent

Turning to undulant fever Dr Savage discussed the available evidence as to the presence of contagious abortion in dairy cattle Raw milk samples contained *Br abortus* in from 8 to 10 per cent of cases, and this applied equally to high class milks Various estimates had been made as to the number of cases of undulant fever in man, but it was evident that man was not readily infected with *Br abortus*, possibly owing to a measure of latent immunity or other factors not yet ascertained Certainly the number of cases of infection in man was relatively small as compared with the wide prevalence in dairy cattle and the opportunities for human infection thereby afforded

He touched next upon streptococcal infections Mastitis in both acute and chronic forms was one of the common sources of infections of the cow, but human infection from this source was very rare In cows mastitis was nearly always due to a streptococcus of a strain non pathogenic to man A point to be remembered was that streptococci from human beings might produce a local infection in the udder of the cow and so contaminate the milk supply Only human streptococcal infections of the udder were infectious to man, and these outbreaks might be of considerable importance because they were so widespread Dealing next with Salmonella infections in the cow, he said that outbreaks which were clinically acute food poisoning with milk as the vehicle appeared from time to time and in most cases could be traced to a certain cow He had particulars of twenty outbreaks, and a tabular statement of eight of them showed the numbers affected to be from 110 to 523 in individual outbreaks The mortality rate was low

2 When the pain starts in the right iliac fossa and spreads towards the midline

3 When the attack comes on at the beginning of a period or a few days previously

Sackett (*Amer J Obstet Gynec*, 1932, **23**, 849) says that ovarian haemorrhage may be excluded in the first and second weeks of a menstrual period

In severe haemorrhage an ectopic pregnancy may be diagnosed, but this is usually accompanied by anomalies of menstruation and a blood-stained vaginal discharge, which are not features of "lutein haemorrhage" In those cases where the haemorrhage is discovered unexpectedly at operation recognition of its lutein origin will save the unnecessary sacrifice of tube and ovary—I am, etc,

J C LEEDHAM-GREEN,
Resident Surgical Officer, General Hospital, Birmingham

February 24

Progesterone in Pre-eclamptic Toxaemia

SIR—The paper on progesterone in pre-eclamptic toxaemia in the *Journal* of February 13 (p 311) raises the important question of the criteria to be adopted in determining the severity of a case of toxaemia of pregnancy when the efficacy of any new treatment is under consideration The authors of the paper have taken the incidence of fits after the institution of hospital treatment as such a criterion Surely fits occur so seldom even in severe cases once hospital treatment has been established that some other index of severity must be adopted? The main if not the only end of treatment in these cases is the securing of a live child Recovery of the mothers can be assured in practically every case, at all events immediate recovery, if induction of premature labour is practised regardless of the viability of the foetus The success of any new form of treatment can therefore only be measured by the extent to which it significantly modifies the proportion of live children obtained Judged by this criterion the results of progesterone therapy do not seem encouraging

Although the clinical results of the research may be inconclusive the authors have, however, done a very real service in correlating the two problems of pregnancy toxaemia and the hormonal changes which occur at the end of pregnancy It may well be that the causes of the onset of normal labour are to be found in a study of those factors which bring on labour prematurely in the majority of cases of toxaemia, even in cases where intrauterine death of the foetus cannot be held responsible—I am, etc,

PERCY MALPAS

Liverpool, Feb 23

Hypochromic Anaemias and Iron Deficiency

SIR—I hasten to apologize to Dr Fullerton for the misquotation which he pointed out in his letter in the *Journal* of February 27 (p 471) The figure which was meant for the iron in lactation was 250 mg, not 750 mg, an approximation to nine months' lactation at about 1 mg a day

With regard to Dr Fullerton's other complaint, the whole matter seems to me to hinge on his statement in his letter to you that he found 9 grains of ferrous sulphate 'a satisfactory dose in the great majority of cases" If he had left out the word "great" I should have been in complete agreement with him The opinion I have formed is that the number of patients who require a larger dose is sufficiently high to justify stating the *average optimum* dose at a higher figure In this context I think my statement that only ten out of twenty one cases in his series responded satisfactorily is a fair criticism He has formed the opinion that the other eleven failed to respond because of complications or because, like Case 18, they did not take all of the dose None of the complications as given in the paper is an absolute bar to satisfactory response, and from the facts which he gives it is open to me to form the opinion that, had he used a larger dose, more than ten, although probably not all the twenty one, of the cases would have responded by 1 per cent per day My remarks were in no sense a criticism of his work, which is to me most interesting He rightly excluded nine cases in the attempt to make a comparison between the different iron preparations I am only critical of his conclusion from rather a small series of cases that "iron and ammonium citrate grains 90, pil ferri grains 45–60, and ferrous sulphate grains 9 are equally efficacious" I do not think that his figures prove this, and I should be sorry to see the value of large doses of iron lost sight of After all, ferrous sulphate, 3 grains three times a day, has been in many pharmacopoeias for a very long time, but the value of iron therapy only came into its own with the introduction of larger doses

My conclusions about the average optimum dose of ferrous sulphate are drawn not from Dr Fullerton's paper but from my own experience and that of other physicians—I am, etc,

J F BROCK

Cambridge March 1

Prostatectomy by the Two-stage Method

SIR,—Mr Walter W Galbraith, in his letter in the *Journal* of February 27 (p 472) criticizing my article on prostatectomy by the two-stage method, takes me to task for, among other things, using a "messy" suprapubic box which is applied not only outside the bladder but also outside the abdominal wound

Yet he advocates a method which necessitates a catheter in the urethra and bladder for twenty or more days in the majority of cases I have visited some of the patients operated on by one of the greatest exponents of the Harris technique which Mr Galbraith thinks so "amazing," and, when I have watched the pus dripping from the urethral meatus of a swollen penis during catheter drainage and the urine leaking from the suprapubic incision after the catheter had been removed, I have come to the conclusion that it was one of the most repulsive sights I have ever seen in post operative convalescence As to the box being "messy," I should have thought it would be much more to the point to attack those responsible for the post operative treatment rather than the technique of the operation

Mr Galbraith, who evidently looks upon a preliminary cystotomy as a 'major" operation asks if I use a third anaesthesia when I remove the gauze packing from the prostatic cavity I can assure him that an anaesthetic is not necessary for the removal of the gauze when it is properly inserted

Mr Galbraith goes on to tell us that the Harris technique is 'a tremendous advance' on the Thomson Walker operation I should like to know what are his grounds for thinking so In my opinion for those who prefer an "open operation the Thomson Walker technique in which the patient is left with a large vesical outlet is infinitely superior to that of the Harris method in which the patient is left with a deformed vesical neck

Mr Galbraith says it is obvious that I know little about the Harris technique because I state that the bladder neck is sutured round the indwelling catheter I actually said 'The mode in which the bladder neck is *sutured* round the indwelling catheter which is left *in situ* for ten or more days after the operation" I did not infer or state, as Mr Galbraith evidently thinks I did that the bladder neck was sutured round the indwelling catheter while the instrument was *in situ*

Human Infection of Milk

Turning next to disease spread through human infection of the milk Dr Savage discussed diphtheria, scarlet fever typhoid and paratyphoid fever and dysentery In the recent report of the Cattle Diseases Committee there was a list of milk-borne outbreaks occurring during the period 1900–31 which happened to be known to the Ministry of Health but many outbreaks though recognized as due to contaminated milk were not reported

The list mentioned included fourteen outbreaks of diphtheria twenty eight of scarlet fever, thirty of enteric fever four of typhoid fever and dysentery, and seven of paratyphoid fever In the United States the outbreaks were more systematically recorded or were more numerous He also gave examples of the recent (1936) very extensive outbreak of enteric fever in Bournemouth and Poole mentioning that some of the later cases arose even within his own area in Somerset In the Chelmsford outbreak in 1935 there were 487 notified cases and about 2 000 cases of illness, with six deaths

He concluded by saying that the evidence that milk served as a vehicle of infection was overwhelming As regards tuberculosis the extent of the disease so spread could be estimated with reasonable accuracy and constituted an amount of infection which was a standing disgrace to the legislature, since the remedy was known not difficult of application, and was only prevented from being applied by considerations which should not be allowed to weigh against the proved damage caused In the case of undulant fever an estimate of the damage was gradually being reached and with regard to other milk borne infections the evidence showed that these were far from being negligible

Incidence of Br Abortus Infection

Professor F S MINETT (Royal Veterinary College) said that at the Roval Veterinary College a good deal of work had been carried out on *Br abortus* infection and the incidence of this organism in milk The incidence could not exactly be stated, it depended on a number of different factors such as the amount of milk tested, the number of guinea pigs injected and the technique used for examination It appeared as though clean milk was very much more heavily infected with *Br abortus* than ordinary milk It was evidently more easy to isolate the organisms from milk which was clean than from milk which was dirty Further work however, showed that it was not the bacterial flora in the milk that was causing the difficulty in the isolation of *Br abortus* but rather the incidence of the tubercle bacillus in the milk samples When there were put into the guinea pig at the same time the tubercle bacillus and *Br abortus* it often happened that the latter could not be isolated

With regard to streptococcal infections which were milk borne Dr Savage had referred to the hypothesis that streptococci originating from human beings might produce a local infection in the cow's udder and so contaminate the milk supply This hypothesis had received a good deal of support from observation and experiment—so much support, indeed that it could not be doubted that it was correct Streptococcal mastitis was very common in cows and so far as it was due to haemolytic streptococci it might be said that the form of mastitis due to weakly haemolytic streptococci was of no importance from the point of view of human health but another group in which the disease was caused by the active haemolytic streptococcus deserved to be considered further in that connexion The contamination of milk must be either direct from human beings or indirect from the cow, and it seemed to him that all the evidence pointed to the fact that infection of milk was indirect and via the cow The evidence which supported such indirect contamination of milk could be discussed as epidemiological cultural and the evidence directly concerned with the animal These widespread and continuous epidemics in human beings could scarcely be due to casual or intermittent contamination With regard to the second point it was not easy to say whether the streptococcus grew in the milk or not It was necessary to consider the strain of the streptococcus used whether recently isolated or a fairly old cultural strain the number of streptococci in the milk and the atmospheric temperature at which the milk was stored The results of the investigation indicated that *Streptococcus pyogenes* would grow in sterilized milk slowly, in pasteurized milk the organisms would not grow or would grow only extremely slowly and after a good deal of lag

The Doncaster Epidemic

He proceeded to speak of the epidemic of scarlet fever at Doncaster in December last some account of which was given in the *British Medical Journal* of January 2 (p 26) This epidemic involved 268 people of whom three died The cases were found to be connected with the milk supply from one farm which was immediately stopped Most of the cases started on December 10 11, and 12 He was permitted to mention some of the findings of Dr F Griffith of the Ministry of Health On December 15 it was proved that the cases of scarlet fever were due to a Type II scarlet fever organism On December 16 mixed samples of milk from groups of cows on this farm were examined and from one of the groups —a group of four cows—some organisms were obtained The next examination was made on December 20 and the four cows belonging to this group were examined From one of them again Type II scarlet fever organisms were isolated On December 30 milk samples were examined from all the thirty one cows in this herd and from one cow scarlet fever streptococci were obtained and subsequently shown to be of Type II The organism was not found in any of the other cows

The speaker showed a photograph of this cow He found scarlet fever streptococci Type II in it on January 6 23 and 28 These organisms however were only forthcoming from the left front quarter of the udder whereas Dr Griffith had previously found them in both the right and left front quarters The herd had been examined by a veterinary officer on December 15 from three to five days after the bulk of the human cases occurred On that date the cow was practically normal as regarded her health There was some induration of the right front quarter Not until December 20 was there an actual mastitis in that cow

Human Infection Transmitted to the Cow

Dr W McD SCOTT (Ministry of Health) said that in addition to the two groups of infections mentioned by Dr Savage—namely, human infections associated with an infection of the cow and diseases spread through human infection of the milk—there was a third group in which diseases normally affecting man were transmitted to the cow and resulted in the presence of the infecting agent in its milk Enteric fever might though rarely be a bovine infection and a cow suffering from it might then transmit the disease in its milk One reason for suspecting this sequence of events—namely human infection of the cow proceeding to infectivity of milk was the degree of infection Droplet infection or direct contamination from a milker or milk handler could scarcely produce disease in so large a proportion of human consumers One outbreak of enteric fever of over 1 000 cases was traced to a single milk supply It was discovered that the cows had as their drinking place a small river into which a few hundred yards upstream a sewage effluent was discharging and when this was examined it was found to contain enormous numbers of typhoid bacilli some hundreds per cubic centimetre It was possible and even likely that the cows during drinking and wading in the stream acquired surface contamination of their legs and udders and equally likely that this contamination might be conveyed to the milk in spite of the regular washing of the udders before milking But it seemed improbable that such an accident could occur every day throughout

After this he writes That is only one of his misstatements (to call them nothing worse) his whole paper bristles with them So far Mr Galbraith has not brought to light any misstatements I should have thought that after making such a sweeping assertion it was his duty to do so

The late Mr Harris operated on two patients at St Paul's Hospital during his visit to London in 1935 and it is with the greatest reluctance that I make a few critical remarks about the convalescence of these two cases but as Mr Galbraith claims so much for the Harris technique I feel compelled to do so The first patient had an indwelling catheter for ten days following the operation and after the instrument was removed the urine leaked through the suprapubic incision for three days In the other case Mr Harris inserted a suprapubic tube as he was unable to control the haemorrhage from the prostatic cavity Yet Mr Galbraith writes that the Harris wound heals by first intention

Near the end of his letter Mr Galbraith tells us that vesical neck pockets are unknown Does he mean they do not exist? Taking into consideration the shape of the prostatic cavity and the method of suturing used in the Harris technique I should say that it is absolutely impossible to prevent puckering and pocket formation in a very large percentage if not all of the patients

For some time I have been convinced that the two-stage prostatectomy through a short suprapubic incision will cure the largest number of patients with the least risk and on carefully reading Mr Galbraith's letter I certainly fail to find anything to make me think otherwise —I am, etc,

London W1 March 1 W K IRWIN, F R C S

Psychological Factors in Rheumatism

SIR,—Dr J L Halliday, in your issues of January 30 and February 6, deals in exhaustive and delightful fashion with the above subject The beauty of his diction however, should not place him above criticism and cramped as must be the exigencies of space in a letter I would like to make a few remarks My qualifications for doing so are, among others

1 I have had about thirty years experience as a general practitioner among a class of patients peculiarly prone to rheumatic affections of various types

2. The class of patient Dr Halliday reviews is also mine

3 For almost twenty years I was medical officer to a prison where I saw roughly twenty of Dr Halliday's type of case to his one

4 As one whose living is exposed to the same chances and changes as that of my patients I conceive I am in a better position to deal with them than one whose life is that of a State medical officer

5 I understand Dr Halliday has never done general practice, and it is evident from his article

I deprecate Dr Halliday suggesting that the Fathers of Medicine were blind to the psychical factor in their cases I was taught that my bedside manner should aim at gaining the confidence of my patient that I should do nothing to alarm and should train myself to absorb the whole atmosphere of my patients surroundings It is common knowledge how well the old physician did so

God and the Doctor we adore etc Does Dr Halliday suggest we should leave the waters charted by the Fathers of Medicine to voyage with him in unknown seas with psycho analysis as compass and Mrs Eddy in the crow's nest? There would be strange landfalls! Possibly we would discover that modern Golden Fleece'—the osteopathic lesion All this type of rheumatic case has some advantage—monetary or other—in assuming proud backs etc The father who can't get work naturally wishes to save his face before his family etc

My experience as a prison doctor may be illuminating. Every day there came to our door one or more men with lumbagos proud necks stiff joints and all the stigmata set forth by Dr Halliday These had existed for varying lengths of time—some many years—and many thousands of pounds had been paid out by different agencies to these people in consequence of their disabilities Each case was treated very seriously by the medical officer The patient was most strictly examined He was put to bed in hospital in a room by himself He was given his choice of castor oil or Epsom salts A Bible was put in his hand and his diet consisted of two pints of buttermilk three times a day In twenty years there was no case that did not recover completely within twenty four hours The cure endured throughout the sentence —anything up to two years—but the condition returned in variably and immediately on the prisoner's release

Dr Halliday would suggest he has discovered something new The conditions he describes are as old as the boy shamming sick who does not wish to go to school I would suggest it is a hazardous proceeding to correlate such common factors as rheumatism and 'misfortune,' and then explain them in terms of each other After all the chances are we shall all be orphans and all have rheumatism some time or another If on the other hand, I saw it frequently happen that a patient who had had the worst of a deal with his pawnbroker developed obscure testicular pain or a racing motorist who had had "big end" mischief quite frequently developed obscure rectal mischief, I should say there was a lot in Dr Halliday's argument It is ludicrous, *pace* Dr Groddeck that when a mother dies he blames himself for it' If that be true I must be an exception to the rule for I never thought such a thought nor have I ever found it in my practice What makes me guarded about psycho analysis is that we have no guarantee that the doctor is not in his own way just as queer as his patient When all is said and done all of us are in our different ways trying to escape To be able to escape is our only chance to remain sane To say that those cases should be sent to the priest or the parson for cure is surely a counsel of despair —I am etc

Wax Solvents

SIR —I read with interest Mr Terence Millin's memorandum on the removal of wax from the bladder (*Journal* February 27, p 446) A short time ago I was asked to treat a case of chronic discharge from the ears The drums were intact and the patient an otherwise healthy young man The traditional methods of irrigation following the instillation of peroxide and bicarbonate gave no relief, and I therefore endeavoured to find some solvent which would penetrate and soften the wax while carrying through it some antiseptic substance It appeared to me likely that there was a vicious circle of wax formation—mechanical irritation of the meatus infection and then more wax formation in response to these stimuli My textbooks contained no description of the properties of the wax found in the human ear nor did a chemical dictionary give much help I was also unable to find any reference to solvents which might be used with safety in the ear other than those I have mentioned However I did not anticipate that harm would result if liquid paraffin were instilled and this was employed as a vehicle for acriflavine The results were most gratifying After three or four treatments both ears were again healthy and there has been no relapse though the condition had been present for eighteen months

I consider this to be a rational treatment and have no hesitation in recommending it to others I have since

the whole of three weeks and provide each day a fully infective dose, especially when one considered the great dilution which must have resulted from bulking the milk with that of other farms, and the same principle seemed to attach to the idea that typhoid bacilli ingested by the cows would survive in the alimentary canal and be discharged in the faeces and in sufficient doses contaminate the milk. Was it possible that a cow ingesting sewage contaminated with enteric fever could itself become a profuse source of these bacilli? It was most regrettable that it was too late to get direct proof in this instance.

Need for a Safe Milk Supply

Dr C. O. HAWTHORNE said that the first impression formed in the mind of anyone listening to that discussion must be the seriousness of the indictment which had been brought against milk as the agent responsible for diseases in human beings. Was there any other subject on which there was so decided and unanimous an opinion as the proposition affirmed by the three speakers they had already heard? Public opinion was not thoroughly informed on this subject. There were indeed direct challenges in the public press to the facts and conclusions which had been brought forward that day. A letter recently appeared in the *Times* written by a Member of Parliament challenging the figures in regard to deaths from bovine tuberculosis, and stating that instead of 2,500 or 3,000 cases of fatal bovine tuberculosis per annum there were not more than 500. It was true that there had been an authoritative statement in reply by the President of the Royal College of Physicians, but the particular figures brought forward had not been challenged, as they could only be, by experts in this subject. The education of public opinion had been conducted to some extent, but it still remained true that innumerable school children were receiving raw milk as part of the school regime. He urged that experts should not be content to remain in academic seclusion, and when they saw statements in the Press which challenged the position they had verified they should come down into the arena and show the scientific foundation for the argument which the medical profession had adopted—namely that milk might be clean, but might still be unsafe, and that in order to make it safe it had to be treated by some heat process.

Mr TOM HARE rose to suggest that as practical men and veterinary scientists they should keep a sense of proportion in this matter. He considered that there was a great deal of exaggeration in such a speech as Dr Hawthorne had just made. He hoped that account would be taken of the fact that the veterinary services of the country had considerably reduced the incidence of tuberculosis in dairy cattle, and he suggested that the leaders of agriculture as well as of the veterinary profession in this country were not doing any disservice when they emphasized the importance to health of the consumption of a clean raw milk by the community.

Mr STEELE BODGER also considered that the "milk-borne epidemic" theory was being overdone. By the adoption of pasteurization of milk the disease problem was being attacked from the wrong end. All this talk was giving a false sense of security. A safe raw milk could be produced if the community was prepared to pay for it. As one interested in clean milk production from the veterinary point of view he knew of nothing which was more calculated to encourage slovenly production of milk than the knowledge that it was going to be pasteurized. The dirtiest milk in the Midlands came to London because it was known that here it would be pasteurized, and thus it was thought it did not matter. He begged those concerned not to hide their heads like ostriches and imagine that in pasteurized milk they had a panacea for all milk ills.

Dr J. F. BROCK said that the discussion had emphasized the importance of the medical profession not only understanding the position with regard to milk-borne diseases but also using its information for the benefit of the public. Members of the profession, particularly those associated with any form of scientific research were averse to being regarded as propagandist, but sometimes in their detachment they did forget their responsibility for educating the public. There was clear evidence that milk was an important factor in the dissemination of disease, and the public must be informed as to the best means of preventing disease arising from this source. Undoubtedly the production of a pure milk supply was one of the most important factors, but were they in the main time to allow the dissemination of disease to go on constantly because they were not prepared to purify their milk on the spot?

Dr RICHARD HAMBURGER mentioned that in Germany the medical profession and the consumers had decided not to use any kind of milk other than boiled, and the profession there was of opinion that there was no difference between the feeding results with raw and with boiled milk. Dr E. WHITE considered it necessary to add to what had just been stated that in Germany measures were taken to ensure cleanliness of the milk before boiling. With regard to medical men coming into the arena and expressing their views in the Press, he said that they were naturally hesitant of so doing because of the tendency of the Press to publish only extracts from communications which might give a wrong impression. Dr R. P. WILLIAMS mentioned an epidemic of scarlet fever in a sanatorium due to infection carried by one man in the attached dairy, the trouble might have been obviated by pasteurization. Dr SAVAGE, in his reply, took up the question of the Montreal typhoid epidemic, which had been attributed by one speaker to pasteurized milk. He denied this, saying that the milk in question had not passed through the pasteurizing process.

EPIDEMIOLOGY OF WEIL'S DISEASE

At a meeting of the Section of Epidemiology and State Medicine of the Royal Society of Medicine on February 25, Surgeon Rear-Admiral S. F. DUDLEY, R.N., presiding, Dr J. M. ALSTON and Major H. C. BROWN brought forward a communication on the epidemiology of Weil's disease.

The authors stated that this disease was defined as a clinical entity by Adolf Weil in 1886. The name "Weil's disease" was then applied to many cases of infective jaundice, but so long as there was no description of the specific anatomy of the condition nor any discovery of specific cause there was always considerable doubt as to the applicability of the name in individual cases. In 1915 Professor Inada of the Imperial University of Japan described a form of spirochaete as the causal organism of the disease. This was now known as *Leptospira icterohaemorrhagiae*, and Professor Inada's work was confirmed by Hubener and Reiter in Germany. The disease was found extensively among the coal miners and field workers in Japan. The illness took the form of fever, conjunctival congestion, jaundice, haemorrhages in various parts, and muscular pain, and there was a marked effect on the kidney as shown by albuminuria. These discoveries and confirmations about 1915 were facts which put Weil's disease in a definite and well-identified position, and it was since that time that the most important information from the epidemiological point of view had been collected.

The distribution of the infection was nearly world wide. The countries with highest incidence were Japan, the Malay States, Netherlands East Indies, Holland, and France. In contrast to these areas of high concentration there were some in which the disease had not been established—namely, Egypt, Persia, and India. Strong sunlight had a damaging effect on the organism, and possibly this accounted for the relatively low incidence in those countries. It was clear that with improved methods of detection many more cases of the disease were being found. In the British Isles between 1922 and 1933 the

read an article by Natier in the *Revue Internationale de Rhinologie, Otologie et Laryngologie* (1898, 1) in which it is stated that two-thirds of dry cerumen are made up of fatty substances soluble in alcohol and ether and that cholesterin represents 7 per cent The other constituents are also described, but unfortunately there is no description of the solvent effect of paraffin on any of these I do not know whether dilute xylol could be used in the ear It is worth trying—I am, etc,

Buxton, Feb 27 G C PETHER, M D

Radiograph or Radiogram

SIR,—I have recently had brought to my notice a short article in the *Morning Post* of Friday, January 22, 1937, headed "What is a Radiogram?—by our Medical Correspondent" This letter refers to correspondence in the *Lancet*, from which it appears that an endeavour is being made to support the use of the word "radiogram" in referring to what the general public call an "x-ray photograph"

I am addressing you on behalf of the British Institute of Radiology to urge that such a step be strongly opposed by the medical press of this country The word radiogram is a reasonable contraction of radio telegram, and as such it has been in use for something over thirty years, the fact that it has recently been adopted also as a contraction for radio gramophone may cause some concern to the Postmaster-General, but makes it still less desirable to employ the word in the manner suggested in my first paragraph The word "radiograph" has been used by most radiologists, and many of their colleagues, for probably a similar period, as a contraction for x-ray photograph It is by no means an ideal word, especially as it is used also to denote an instrument for recording intensity and duration of sunshine, there can be no doubt, however, as to which of the two meanings is more generally understood If a better word than radiograph could be coined it would be very acceptable, but there appears to be no valid reason for discarding it for a word which has nothing to recommend it, and which is already in general use under an entirely different meaning There is something to be said for the word "x-radiograph,' but it is clumsy, and would almost certainly be shortened to radiograph within a short space of time

I brought this matter up for discussion at last month's meeting of the Medical Committee of the British Institute of Radiology, which considered that nothing had occurred to alter the opinion which it recorded in November, 1934, when the following resolution was passed

"After discussion it was unanimously agreed that in referring to the photographic product of an x-ray examination the word 'radiograph' should be used, both as a noun and as a verb, in the same way as the word 'photograph' is used It was pointed out that this is correct according to the *Oxford Dictionary*"—I am, etc,

R BOULTON MYLES,
38 Welbeck Street London, W 1, Honorary Medical Secretary
March 1

*** We are in entire accord with the resolution passed by the Medical Committee of the British Institute of Radiology It is our practice to use the word radiograph in preference to radiogram, which is now in general use either for a message transmitted by wireless telegraphy or for a combination of a wireless set and a gramophone The *Oxford English Dictionary* defines radiograph in this context as "an impression or image of an object produced on a sensitive plate by means of the Rontgen rays"—ED *B M J*

Language for the Deaf

SIR,—The recent correspondence in the *Times* on the subject of "language for the deaf" may have attracted the attention of the medical profession Interesting however, as was this correspondence, there is reason to fear that since it dealt almost exclusively with *methods* of teaching, it has only served to obscure the real object of special education for the deaf The object of such education is to enable the born deaf (totally or partially) and those who have become deaf (totally or partially) before full spoken language has been acquired, to understand and use the English language *as it is written*

There is difference of opinion as to how this object can most rapidly be attained—that is to say, those best able to judge do not agree as to the best medium to be employed The pure oralist would allow no finger spelling or signing (the two are quite distinct) in the classroom, and would do his best to stop signing out of school The pure manualist would say that since the speech of the deaf is rarely pleasant or very intelligible, and since lip-reading is an unreliable medium, it is a waste of time to teach either

Between these two extreme views there are the opinions of experienced teachers who favour this or that combination of mediums Good results have been attained by any of these methods One is tempted to say, "That which is best administered is best" All the educated deaf, however, and all those who have spent their lives helping them, are agreed on two points first, that the object of special education for the deaf is to give to every deaf child a thorough understanding of and power to use the English language as it is written Secondly, that, be the method what it may, the deaf child must have at least ten years of steady special education, starting not later than the age of 5 years

Whether the deaf child speaks or whether he finger spells, or whether he does both, such mediums are useless to him in his manhood unless he possesses a full command of that immense intricate arrangement of symbols which we term "the English language" To give language to the deaf is a task of high scientific character To take a deaf child through simple nomenclature of things and qualities to teach him the different modifications to express juxtaposition of things comparison of qualities etc, to unfold to him the absolutely necessary but strangely intricate combination of symbols whereby a verb tense is expressed, to lead him through idiomatic and figurative language—this work possesses a fascination undreamed of by any other body of teachers in the world It is unfortunate that few men and women of first-class intellectual attainments are found to undertake it The field is comparatively small and the financial rewards are modest

Sir, there are deaf men and women of average adult intelligence in England to day who are unable to read an ordinary book or newspaper There are deaf boys and girls leaving school to day who will never understand the English language—that is, they will never be able to visualize from a written description and they will be unable to follow arguments expressed in adult language They could have learnt to do so they were not given the time they started too late

The saddest cases are those of the children of the professional and leisured classes These people are not visited by the attendance officer and they are not compelled to send their children to a special school These people can afford to, and they do, consult general practitioners and

were only four cases recorded, but during the last three and a half years, with better methods of detection, it had been possible to trace 142

Sources of Infection

In most parts of the world rats and some other small rodents harboured the organism and excreted it in the urine This was almost always the direct or indirect source of infection of man, but natural infection of dogs and foxes took place and was at least a potential danger to human beings The degree of infection was greatest in rats of intermediate age and less in the younger and older animals Dogs not only suffered from an illness but could to a certain degree act as carriers without evident infection There was a hint that possibly pigs might be a danger In Germany there was a well authenticated instance of a butcher developing the infection eight days after slaughtering a very jaundiced pig The organism appeared to lead a precarious life outside the animal body It quickly died in an acid medium, in strong sun light, and in salt water

Infection was usually related to occupation in coal mines field work of all sorts sewers, fish cleaning and to bathing in fresh water The route of infection was usually by contact of the abraded or sodden skin with infected mud or water, but infection might take place by imbibition of water and by the bites of rats, dogs and ferrets The question of oral infection had been stressed in Holland, where cases had arisen in people who had fallen into the canal and involuntarily swallowed the water Men were much more exposed to infection than women except fish cleaners, among whom the incidence was equal in both sexes

Incubation and Incidence

The incubation time might be from four to nineteen days, but usually it was from seven to thirteen days The fatality rate was considered in the earlier investigations to be very high, because at that time there was no knowledge of the mild latent or subclinical infections When these were taken into account the mortality was seen to be much lower Among the 142 cases recorded in the British Isles during the last three years and a half the mortality rate was 15 per cent By serological methods many subclinical infections without jaundice could be detected among people who were often at risk

Finally Dr Alston gave a table of the occupations of the persons concerned in the 142 authenticated instances from July 1933 to the present time Of these, forty five were fish workers all at Aberdeen and there were three deaths in this class Only one other case of a fish worker was recorded—namely, in the Isle of Man, a non fatal case There were twenty nine cases among coal miners in Northumberland and Durham with six deaths and five cases among coal miners in other fields with no deaths Among sewer workers there were nineteen cases with five deaths all in London The cases which followed fresh water bathing numbered fifteen with two deaths and occurred in various parts of the country The other occupations or circumstances, numbering seventeen mostly showed single cases There was one instance in London of a laboratory infection In all these circumstances there were three factors the presence of rats harbouring and excreting the organism surrounding dampness helping to maintain the organism s viability and liability to abrasions of the skin among those engaged in the particular work One of the means of prevention was to block up imperfect and unused drains and so stop the access of rats to the sewers and on fish curing premises, to practise methods of rigid cleanliness so that rats were not attracted to the offal

Discussion

Dr H J PARISH remarked that in view of the huge rat population of this country it was rather puzzling that there were not more human cases He also asked a question with regard to laboratory infections Was there such a risk of, say, a fragment of guinea pig liver which had been mashed up getting into the conjunctiva as to make it desirable for laboratory workers to wear protection for the eyes? Dr J D ROLLESTON referred to incomplete forms of the infection, to which there was a parallel in the *forme fruste* of the acute exanthemata which had no rash or of poliomyelitis which had no paralysis There had lately been published in France an account of special localization of leptospiral infection in the meninges giving rise to a mysterious form of meningitis there had also been a few such cases in Holland Apparently it occurred in just those occupations—sewermen and scavengers, with the addition of well sinkers—which were most often affected by Weil s disease

Dr C F WHITE medical officer of the Port of London, said that so far no cases had been known to occur in the port, but he was sending some live rats from the docks and ships for investigation to ascertain whether they harboured the leptospira It should be remembered however, that docks and ships were now more free from rats than most shore premises Dr J E MCCARTNEY said that on the Western Front during the war a number of cases of leptospiral jaundice were found The route of infection was thought to be sodden skin rather than abrasions Some cases were found in rat-infested dug outs where there was no moisture and it was believed these were due to alimentary ingestion of the parasite Mr GRAHAM a layman concerned with the construction of sewers asked whether there was evidence that this disease was of recent introduction Until the last four or five years nothing was heard about it so far as sewer workers were concerned Hitherto the health of sewermen had been rather a matter of pride

Dr A JOE mentioned that the first case of the disease he saw was in Edinburgh in 1923 in a man working in the grain store of a brewery Dr J ALISON GLOVER referred to the absence from the list of cases and occupations of workers on refuse dumps Was this immunity due to exposure to the air and relative dryness? He also asked whether the black rat was as susceptible as the brown Dr E W GOODALL remarked on the curious fact that practically all the cases among fish curers occurred at Aberdeen Yet it was said that the organism died quickly in salt water Dr PERCY STOCKS asked whether the term 'rat-bite fever' was a sufficient description of the disease What was the best title for international use? A committee was now sitting on the revision of the international list of causes of death and was proposing to give a separate number to this disease It was not considered desirable to attach a man s name to a disease on account of the controversy which ensued at international conferences!

Major H C BROWN said that with regard to nomenclature, if it was not to be called Weil s disease he thought the most appropriate title would be spirochaetal jaundice The expression infective jaundice should be avoided on account of confusion with infective catarrhal *jaundice*" 'Rat bite fever' was a totally different disease due to another organism The brown rat was distinctly more susceptible to the disease than the black With regard to the meningeal form he had heard about the cases in France and a French investigator had told him that a curious agglutination reaction was obtainable in these purely meningeal forms In such forms a positive reaction was never obtained at 1 in 10 dilution that dilution was almost invariably skipped With regard to the *possibility* of conjunctival infection in the laboratory, he was certainly of opinion that glasses should be worn As to the relative rarity of cases considering the huge rat population and the opportunities for infection the chances against infection had to be remembered Not only must the infecting organism be present but also an abrasion of the skin Otherwise unless it entered by the conjunctiva or nasopharynx, the chances of evading infection were very great

specialists These people can afford to, and they often do buy one or other of the instruments by means of which, as advertised, the deaf can hear '

Useful as some of these instruments are in some cases of acquired deafness among adults and to somewhat improve the speech of deaf children they can never take the place of special instruction in language Consider it takes a normal child five years of 365 days each working at it as he does all his waking hours to acquire such a knowledge of English as we associate with children of that age *It takes him five more years, working at it all* his waking hours, to acquire the language of a 10 year old child Is it likely that through the eye possibly assisted by some indefinite sound hearing a deaf child can get a command of English in less than ten years?

Yet parents are advised to wait and see — he is not totally deaf — he must not mix with the deaf and dumb — perhaps hearing will develop — let s measure it by means of the audiometer week by week — *response* appears to be hopeful'— this or that vowel associated with this or that word is heard this week and certainly it was not a month ago — let him mix with hearing children'—etc At long last his child reaches the specialized teacher, and eventually is obliged to leave school He has not had time to acquire the English language, and now he never will he might have done it, he might have taken a degree The world of science and literature might have been open to him

The outward behaviour of a deaf child, frustrated *in his efforts to express his own thoughts and to obtain* adequate answers to the natural questions of childhood *resembles closely that of a mentally deficient child* and the greater the intelligence the greater the frustration and the more pronounced the unusual behaviour The more hearing power possessed by the child the less his chance of getting early to a school for the deaf—the only place where there are people specially trained to teach him

I would ask, therefore that in all cases of apparent subdevelopment of spoken language partial deafness should be assumed as the most probable cause and the child given a chance of starting at once to learn the English language The speech clinic is not the place for him, neither can the elocution teacher tackle such a problem At a school for the deaf a few weeks will show whether the child can learn language In any case no harm will have been done—I am, etc,

London N W 1 Feb 24 BLANCHE F NEVILE

University of London Medical Graduates Society

SIR—The University of London and its graduates are entering into a new heritage as their great building rises in Bloomsbury for it will create a centre of university life such as London has long desired The future however, will be made by man and not by stones, for the traditional spirit of great centres of learning is created by the men who move in them Our University has yet to develop its traditions in the *fullest sense for hitherto* the graduates have had few associations with their University except as an examining body, and among the medical graduates the loyalties of professional life are given chiefly to their own medical schools This has led in the past to a narrowing of outlook and has been a hindrance to progress Lister was a London surgeon yet London was almost the last of the great centres of medical work to acknowledge the truth of his teaching He himself attributed this to the lack of a university and of the university spirit which valuing the search for truth above all else, subordinates to it all considerations of personal advantage

London can never enjoy a university life as intimate as that which exists in smaller towns but with the co operation of its graduates it has now an opportunity of developing a university spirit and tradition along its own lines

Nine years ago the University of London Medical Graduates Society was formed to provide a social meeting ground and bring all graduates of the medical faculty of the University *into touch with one another* The University has recently granted official recognition to the society and the annual dinner on May 6 this year will be held for the first time in the University Banqueting Hall The Vice Chancellor has signified his intention of attending the dinner, and it is hoped that the occasion will arouse the interest of medical graduates in their University and that many who are not as yet members will join Oversea graduates who may be in London for the Coronation celebrations will be specially welcome Guests medical or non medical may be invited by members

The objects of the society are in brief (*a*) to bring medical graduates of the University of London into closer relationship with their University and with one another (*b*) to keep in touch with oversea medical graduates of the University, (*c*) to promote the interests of the University *and its medical graduates The society has no* political activities There is an annual dinner in London *during May, and dinners are held in other centres from* time to time whilst an afternoon reception and visits to places of interest take place during the spring

The subscription is £1 for life and applications for membership are invited and welcomed—We are, etc.

Insufficient Sleep for Children

SIR,—In communications which have been appearing lately in both the medical and the lay press on the subject of malnutrition I see little mention of the important *factor of want of sleep in the production of this condition* Sufficient and undisturbed sleep is almost as essential as suitable food for the growing child and the want of it surely plays a leading part in producing the undersized and weary looking child so frequently met with in the slum districts of London and the industrial towns—I am, etc,

London W 1 Feb 27 EVA MCCALL

Protamine Insulin (with Zinc)—Suspension

SIR—The retarding action of protamine with the addition of zinc on insulin has been the subject of investigation for some time past Protamine insulin (with zinc) *—suspension is now made available by the four firms* associated with the manufacture of insulin in this country Messrs Allen and Hanburys Ltd, Boots Pure Drug Co *Ltd, The British Drug Houses Ltd* and Burroughs Wellcome and Co

The preparation is a suspension of insulin with added protamine and zinc of such a character that it is readily and evenly diffused on shaking prior to administration As it is more slowly absorbed than unmodified insulin it

OESTRIN IN BLOOD AND URINE

At a pathological meeting of the Liverpool Medical Institution on February 18, with the president, Professor R E KELLY, in the chair, Dr O VAUGHAN JONES read a paper on the oestrin content in blood and urine, its estimation and clinical application

Dr Vaughan Jones said that within recent years the estimation, detection, and analysis of oestrogenic substances had been the subject of wide research The chemistry of this group of substances was now for the most part known, and already the physiological and therapeutic possibilities of these hormones were being realized In the non-pregnant woman the Graafian follicle was the chief factor elaborating oestrin, and its concentration varied according to the stage of ripening of the follicle, while in pregnancy it was the placenta that produced vast quantities of the hormone During pregnancy large amounts were found in the blood, there being a continual rise in concentration, well marked during the second half of pregnancy

The estimation of oestrin in the urine during pregnancy was complicated by the fact that about 90 per cent of it was excreted in the "combined" form After the third month there was a rapid rise in the amounts of "combined" form excreted, this rise being more marked after the sixth month The concentration of the "free" form of oestrin in the urine was low throughout pregnancy, but shortly before parturition the amounts of the "free" form rapidly increased

Clinical Applications

The application of these laboratory findings was of paramount importance as oestrin must vary in concentration in health and disease Its estimation in cases of menstrual disorders, such as amenorrhoea, metropathia, and at the menopause, might be useful to the diagnosis and prognosis of the case in question With the vast amounts of the hormones produced during pregnancy it would be expected that any upset of normal production would result in a change in the hormone balance in blood and urine When the foetus died *in utero* there must be a complete upset in their formation and excretion The various tests for these hormones should therefore be significant in ascertaining the viability of the foetus

The Aschheim-Zondek test was a test for the viability of the placenta and not of the viability of the foetus When the foetus died *in utero* the Aschheim-Zondek test could be, and often was, positive, this being probably due to the retention of some active chorion epithelium which maintained the production of prolan Thus the Aschheim-Zondek test was unreliable as a test for intra-uterine death of the foetus It had now been generally agreed that the placenta produced oestrin as well as prolan On this assumption it seemed likely that the death of the foetus, which entailed the interruption of the placental circulation, might have an influence upon the hormone level in the blood

It had been found that the blood oestrin content fell to a low level in these cases On this fact had been based a test for the viability of the foetus, whereby the oestrin present in blood was extracted with ether and the extract tested biologically A series of such cases was examined

No	Cases of	Blood Oestrin	Subsequent History
35	Normal pregnancy	Positive	Pregnancy continued
12	? Missed abortion	Negative	Macerated foetuses delivered
29	? Intra uterine death	23 Negative	Macerated foetuses
		6 Positive	Foetus alive

From these cases it was concluded that the blood oestrin test was a valuable and reliable test for the viability of the foetus, and could be done as soon as the death of the foetus was suspected It must therefore be recognized as a test of the utmost importance When the urines of these women were examined it was found that there was no great difference between the "total oestrin" of normal pregnancy urine and that observed in urines from women carrying a dead foetus

In the discussion which followed the PRESIDENT said that real standardization would only come when these fascinating compounds were crystallized in pure form and weighed He was interested in the methods of analysis and the relation of oestrin to the carcinogenic substances

Pathological Specimens

Several pathological specimens were shown at the meeting, among which were two demonstrated by Dr T F HEWER The first was a case of spontaneous fracture of the humerus with carcinoma of the prostate A man of 75 with carcinoma of the prostate had a spontaneous fracture of his humerus, as a result of extensive carcinomatosis, four months before death There was shortening of the bone, but firm union had taken place between the adjacent surfaces of the overlapping segments It was surprising that the carcinoma cells did not invade the traumatized zone, in the manner of a tissue culture, and prevent union of the fracture The second was a case of megakaryocytic myelosis with osteosclerosis A man of 59 had a history of splenomegaly and increasing weakness for ten years His blood picture was one of secondary anaemia with leucopenia The other clinical pathological findings were essentially negative, and a clinical diagnosis of splenic anaemia was made At necropsy the spleen was found to weigh 2 100 grammes, and to contain many small tumours which consisted of bone marrow with great numbers of megakaryocytes, the splenic pulp and sinusoids were full of primitive marrow cells There was no myeloid infiltration of the other organs The marrow cavity of the upper third of the femur was almost completely obliterated by spongy bone, but this was diffusely infiltrated with hyperplastic marrow The marrow in a vertebra was hyperplastic without any sclerosis This was the condition described by Emile-Weil and other French writers under the name of *splénomégalie myéloïde mégacaryocytique amyélocythémique* It appeared to be a reticulosis which had differentiated at the stage of haemocytoblasts and megakaryocytes, and was not capable of producing the requisite number of adult cells The presence of osteosclerosis in the femur without a leuco erythroblastic blood picture was interesting

---

The first annual meeting of the Voluntary Euthanasia Legalisation Society was held in London on February 25 with the president, Lord Ponsonby, in the chair The president said that there was no need for the society to be discouraged by the rejection of the Voluntary Euthanasia (Legalization) Bill in the House of Lords He explained that the opposition to the Bill had been mainly on questions of principle He paid tribute to the work done for the society by its first president the late Lord Moynihan The annual report of the society stated that this country was the pioneer in voluntary euthanasia with no precedent to follow The total membership of the society is 268 (including fifty honorary members) Seventy medical practitioners are members

---

The Queen has graciously been pleased to retain her appointment as Commandant-in Chief of the Nursing Corps and Divisions of the St John Ambulance Brigade Her Majesty, who is a Dame Grand Cross of the Order of St John has always taken a keen and active interest in the work of the Brigade, and has held her present appointment since May, 1928 There are 897 nursing divisions in the St John Ambulance Brigade with a personnel of 19,659 nursing officers and sisters

should be of particular use in cases where unmodified insulin does not provide adequate control or where several administrations daily are necessary While extensive clinical trial has determined the issue of a satisfactory preparation there is still much to be learned about its general use, therefore care will be necessary if reactions are to be avoided due to unfamiliarity with its use or deviations from a properly balanced dietary

Protamine insulin (with zinc)—suspension is issued at present in one potency 40 units per c cm Two sizes are available—5 c cm containing 200 units and 10 c cm containing 400 units The packings will be distinct in colour from existing packings of unmodified insulin — We are, etc,

The Services

THE ARMY DENTAL CORPS

The War Office invites applications from dental surgeons for appointment to eight commissions in the Army Dental Corps Candidates will be selected for these commissions without undergoing competitive examination and will be required to present themselves in London for interview and physical examination about the middle of March 1937 They must be registered under the Dentists Acts or Medical Acts, and be not over the age of 28 years Successful candidates will, in the first instance be given short service commissions for six years at the end of which period they will retire with a gratuity of £1 000 unless during the fifth year they have applied for and been granted permanent commissions Full particulars and forms of application may be obtained from the Director, Army Dental Service, the War Office, London, S W 1

DEATHS IN THE SERVICES

Major General THOMAS MARTIN CORKER C B, late R A M C, died in London on February 24 aged 80 He was born at Cork on May 2 1856 the son of Thomas Ware Corker of Rushbrooke County Cork, and was educated at Queen's College, Cork, where he graduated in 1876 as M A with honours and a gold medal and scholarship in the Queen's University of Ireland, and subsequently as M D and M Ch in 1879 He also studied for a while at St Bartholomew's Hospital Entering the Army as surgeon on March 6, 1880, in the same term as the late Sir Alfred Keogh, he attained the rank of colonel on August 26, 1905 and of Surgeon General on December 11, 1911, retiring on December 26, 1917 As an administrative medical officer he served successively in the Scottish Division, 1905–9, Egypt, 1909–11, Lucknow Division 1911, Poona Division 1912 and Secunderabad, 1913 He served in the North West Frontier campaign in India in 1897–8 on the Malakund and in the operations in the Mamund country, and in the Tirah campaign of 1897–8, taking part in the actions of the Arhunga and Sampagna Passes and in the operations in the Bazar Valley, was mentioned in dispatches in the *London Gazette* of April 5, 1898, and received the Frontier medal with two clasps He was made an Honorary Physician to the King in 1912 and received the C B in 1915 and the degree of LL D from the National University of Ireland in 1920 He was also a Knight of Grace of the Order of St John of Jerusalem In 1886 he married Florence daughter of the late Mr J E Leslie of Lee Carrow Passage West Co Cork He had been a member of the British Medical Association since 1888 and contributed letters from time to time to the *British Medical Journal*

HIS MAJESTY'S HOUSEHOLD

THE MEDICAL APPOINTMENTS

The *London Gazette* of March 2 announces the following medical and dental appointments to His Majesty's Household, to date from March 1, 1937

Physicians in Ordinary
VISCOUNT DAWSON OF PENN G C V O, K C B, K C M G, M D, P R C P
Lord HORDER K C V O, M D, F R C P
Sir JOHN WEIR K C V O M B
Sir MAURICE CASSIDY K C V O, C B, M D, F R C P

Physicians Extraordinary
Sir FARQUHAR BUZZARD, Bt, K C V O M D, F R C P
Professor JOHN A RYLE M D, F R C P
GEORGE FREDERICK STILL M D F R C P
HENRY LETHEBY TIDY M D F R C P

Serjeant Surgeon
WILFRED TROTTER M D, M S, F R C S, F R S

Surgeons
Sir THOMAS DUNHILL K C V O C M G, M D
Sir JAMES WALTON K C V O, M S, F R C S
Sir LANCELOT BARRINGTON-WARD K C V O, F R C S

Surgeon Oculist
Sir STEWART DUKE-ELDER M D, F R C S

Consulting Surgeon Oculist
Sir WILLIAM LISTER K C M G, K C V O, M D, F R C S

Manipulative Surgeon
Sir MORTON SMART K C V O, D S O, M D

Surgeon Dentist
C S MORRIS, M R C S, L D S

Surgeon Apothecary to His Majesty and Apothecary to the Household
Sir STANLEY HEWETT K C B, K C V O, K B E, M D

Physicians to the Household
ARNOLD STOTT B Ch F R C P
DANIEL T DAVIES M D, F R C P

Surgeon to the Household
ARTHUR E PORRITT M Ch, F R C S

Surgeon Oculist to the Household
FRANK ANDERSON JULER M B, F R C S

Surgeon Dentist to the Household
F D DONOVAN, C V O, L D S

Surgeon Apothecary to the Household at Windsor
Sir HENRY L MARTYN K C V O, M B, F R C S

Surgeon Apothecary to the Household at Sandringham
Sir FREDERIC WILLANS K C V O, M R C S

Coroner of the Household
W H L McCARTHY D S O, *M C* M D

Medical Household in Scotland

Physicians in Scotland
JOHN COWAN M D, D Sc, F R F P S
ALEXANDER GREIG ANDERSON M D, F R C P
Professor JOHN WILLIAM McNEE D S O, M D, F R C P

Extra Physicians in Scotland
Sir ROBERT PHILIP LL D, M D, F R C P
Sir ASHLEY MACKINTOSH, K C V O, M D, F R C P Ed

Surgeons in Scotland
Sir JOHN FRASER K C V O, *M C* M D, F R C S Ed
Professor JAMES R LEARMONTH, Ch M, F R C S Ed

Surgeon Oculist in Scotland
ARTHUR H H SINCLAIR M D, C M, F R C S Ed

Surgeon Dentist in Scotland
LESLIE C BROUGHTON HEAD M B, Ch B L D S

Surgeon Apothecary to the Household at Balmoral
GEORGE PROCTOR MIDDLETON M B, Ch B

Surgeon Apothecary to the Household at the Palace of Holyroodhouse
NORMAN SCOTT CARMICHAEL, M B

Local News

ENGLAND AND WALES

Amalgamation of Bristol Hospitals

At a meeting held on February 23 with Colonel P G Robinson, president, in the chair, the governors of the Bristol Royal Infirmary gave the committee power to amalgamate that institution with the Bristol General Hospital This proposal had already been approved by the committee of the General Hospital, and the governors of that institution will be invited to confirm it at a special meeting on March 15 The resolution adopted on behalf of the Royal Infirmary on February 23 makes provision for central administration of the two hospitals the pooling of funds and finance the formation of one joint honorary medical staff, and such centralization of functions as may be agreed upon Professor Rendle Short, who seconded the resolution, said that this had in the first place gone before a united meeting of the medical staffs of both institutions a few months ago and had been passed unanimously

New Dental Hospital for Manchester

At the annual meeting of the governors of the Manchester Dental Hospital on February 26 Professor J S B Stopford, vice-chancellor of the University announced that Mr Samuel Turner of Rochdale had offered to defray the cost of building a new dental hospital and school Three years ago Mr Turner made a gift towards the establishment of a chair of dental surgery, and he has contributed annually to its maintenance The vice chancellor was not able to announce the proposed site for the new hospital or the estimated cost of the scheme He said however that a start might be made on the new building in October Included in the hospital will be a children's clinic, a special department for the treatment of pyorrhoea and other chronic infections of the mouth, and full facilities for research work Professor Wilkinson, director of the hospital pointed out that since 1910 the number of patients treated each year had grown from 20 000 to nearly 40,000 The Manchester Dental Hospital is the only one of its kind in East Lancashire, and receives patients from a very wide area In appreciation of Mr Turner's gift Professor Stopford said It is impossible to measure its value to the city the neighbourhood, dental education and the advancement of dental science Mr Turner realizes that dentistry is of fundamental importance in the domain of preventive medicine and I trust that his gift may awaken others to this fact '

District Nursing in London

The annual meeting of the Central Council for District Nursing in London was held at County Hall on February 25 under the chairmanship of Sir William Job Collins The business was formal, chiefly concerned with the adoption of the annual report The amount which the central council received during the year by grants from trustees of charities subsidies from the London County Council, and a certain number of donations amounted to just over £11,000, and a similar sum has been distributed among the more than eighty affiliated district nursing associations covering the metropolitan area which extends far beyond the county of London The outstanding grant was one of £4 000 from the trustees of the London Parochial Charities for services rendered during the year, to which the trustees added another £500 for general purposes It was reported that the scheme for home nursing of persons coming within the scope of the public assistance department of the London County Council which has now been in operation for four years, was progressing and that under the scheme 181 513 visits were paid to 5 324 cases last year The question of the considerable number of such cases especially in East End districts, which need nursing visits for the insulin treatment of diabetes has been settled by the London County Council for two years on the basis that the payment made by the Council should be at the rate of 6d for each insulin visit previously such visits had counted for grant as half visits There were 24 000 such visits during each quarter of the year that the scheme has been in operation and it is anticipated that the total payment by the London County Council for these insulin visits for the year 1936–7 will be £2,300 A new provident scheme has been launched for the district nursing of Greater London and on the preliminary committee the central council was invited to appoint two representatives The executive however, decided not to express an opinion before ascertaining the views of its affiliated associations On this being done eighteen associations, employing 154 nurses were found to be in favour of the scheme and thirty four employing 227 nurses against It was decided therefore that the central council should not be associated with the scheme It is understood that the scheme is proceeding It was mentioned that the first distribution to district nursing associations by the King Edward's Hospital Fund was made in April last, £2,000 being distributed among 109 district nursing associations This allocation was made in response to representations from the central council An executive committee of thirty members was elected from the meeting Sir Comyns Berkeley and Dr W Paterson, two of the three British Medical Association representatives on the central council (the third being Dr Mary Blair) were appointed on the executive the chairman of which is Sir Francis Morris and the vice chairman Sir Stanley Woodwark

Medical Candidates for the L C C

The results of the triennial election for the London County Council will not be completely known until midday on March 5 but it is satisfactory to note that there is a very strong list of candidates drawn from our profession Newcomers include Dr Doris Odlum who is standing for North Hammersmith in the Municipal Reform interest her special experience should make her a most valuable member of the Mental Hospitals Committee if she secures election but the constituency is not an easy one to contest and it will be a feather in her cap if she succeeds Dr E A Whitfield is a Labour candidate for North Paddington for which he has quite a possible chance of election Dr R F B Bennett is standing as M R candidate for East Woolwich All the other medical candidates are members of the expiring council They include Dr J A Gillison (Lab) for Bermondsey (Rotherhithe) Miss E Rickards F R C S (Lab), for Greenwich, Dr B Homa (Lab) for Central Hackney Dr S Monckton Copeman (M R) for Hampstead Dr Henry Robinson (M R) for North Kensington Dr S W Jeger (Lab) for Shoreditch Dr C W Brook (Lab) for North Southwark Mr Somerville Hastings F R C S (Lab), for Stepney (Mile End) Dr F Barrie Lambert C B E (M R) for Westminster (St George's) and Dr S McClements (Lab) for West Woolwich The superstitious may note that the total is thirteen it is probably too much to expect that all will be elected but it is clear that most of them will be to the advantage of London as a whole

Growing Demand for Hospital Almoners

At the annual general meeting of the Institute of Hospital Almoners held at the Westminster Palace Rooms on February 25 when Sir George Newman gave the address a very successful year's work was reported. The great need for more almoners to fill the posts which are rapidly materializing was stressed The number of students in training at present is the highest on record but the number of new posts also grows and there are not enough almoners to meet the demand The Executive Council reported that during last year four opportunities of opening new departments were lost and two established

Obituary

SIR HENRY JACKSON, BT M B

Member of Parliament for Central Wandsworth

Of the small group of medical members of the present Parliament Sir Henry Jackson, who died suddenly after speaking at a public dinner on February 23, was so much occupied with other and quite different interests, and such an expert in them, that one did not at first think of him as a doctor with a practice on Putney Hill He might have been described as one of the medical truants,' giving to public affairs, particularly transport the gifts and driving energy which might have been devoted to medicine only

But Sir Henry Jackson had that combination of qualities which enables a man to ensure success in many different spheres He did not join the medical profession until 1914, when he was nearly 40 years of age, and then after taking the M B and Ch B degrees at Edinburgh he served in the R A M C, attaining the rank of major During the ten years 1901 to 1911 he had been Fellow at Downing College, Cambridge, and lecturer in natural science It might have been possible to see in the Cambridge tutor the future general practitioner, but hardly the future expert in transport problems or Post Office rates or London bridge constructions His early scientific career was a distinguished one He obtained a first class in Parts I and II of the Natural Sciences Tripos He was a contributor to the *Transactions* of the Cambridge Philosophical Society, the Chemical Society and the Royal Society, and treatises from his pen on such subjects as glycogen and the synthesis of the derivatives from citric acid formed an unusual preparation for the hurly burly of public life

He was also singular in another respect—although a Lancashire lad, having been born at Heywood just over sixty years ago and educated at Bury Grammar School, not really settling in London until after the war, he adopted the metropolis, or it adopted him so completely that he became one of the leading Londoners of his time Practically his first entrance into public life was when he became a member of the Wandsworth Borough Council during the year after the war He made his name on the Public Health Committee, his personality and parts were quickly recognized, and within two years he was mayor of this the largest of the London boroughs and one of the most popular mayors that Wandsworth has ever had He was mayor for three years, voted to that position unanimously by a council which contained a considerable proportion of his political opponents But although a keen party man—he made a strong party speech on the day of his death—there was something about him which made him popular with all parties A fellow member of Parliament has stated that only a few hours before Jackson died he saw him with his arm round the shoulders of Mr James Maxton—a man at the opposite pole of political thought—exchanging stories It was this bon homie, reflected in his rather Pickwickian countenance which carried him far and his substantial intellectual gifts reinforced by a sound scientific training carried him further He resigned his mayoralty in 1924 to become parliamentary candidate for the central division of his borough, he was returned, and he continued to represent it, with one short interval until his death

Sir Henry Jackson took little part in medical politics, but he had an abiding interest in hospitals and was a keen upholder of the voluntary system He was a member of the London Voluntary Hospitals Committee, also honorary treasurer of Bolingbroke Hospital, Wandsworth, where the erection of a new wing and its opening free of debt was one of his achievements During his mayoralty he was instrumental in raising something like £20,000 for hospitals in his borough On several occasions he appeared in the pulpit on Hospital Sunday He was also a keen educationist, championing the cause of the teachers in elementary schools He was accustomed to say that if Waterloo was won on the playing fields of Eton, the great war was won in the elementary school playground

But it is probably as a traffic expert that he will be remembered He was chairman of the London and Counties Advisory Committee on Traffic, and on various other bodies which had to deal with that problem No select committee on the subject was complete without him In the House of Commons he was seldom heard in debate, but in committee work his knowledge and judgement on many difficult questions, especially transport but also on health, were highly esteemed He was one of the very useful men of his generation, and afforded a conspicuous instance of a man trained in science and medicine achieving rapid and substantial success in municipal and national affairs

F P F RANSOM M D

Late Professor of Pharmacology University of London

Dr Frederick Parlett Fisher Ransom, who died at Weston super Mare on February 22, was formerly well known as a teacher and research worker in pharmacology He was born at North Elham Norfolk in 1850, and began his medical studies at King's College London, qualifying M R C S and L R C P in 1871 He then went to Edinburgh where he obtained the M D degree in 1875 Continuing his studies in Germany, he was for a time assistant to Professor von Behring at Halle and to Professor Hans Meyer at Marburg Dr Ransom was for a long time lecturer in pharmacology and head of the pharmacological department at the London (Royal Free Hospital) School of Medicine for Women and received eventually the title of professor of pharmacology in the University of London In the early years of this century he published papers on saponin and cholesterin on tetanus (with Professor Meyer), and on bronchodilator nerves (with Professor W E Dixon) During the war he served on the War Office Tetanus Committee, and published in the *Lancet* a paper summarizing modern views on this disease, he also contributed papers on antagonists of pilocarpine to the *Journal of Pharmacology* and on the cardiac haemolytic effects of digitonin to the *Biochemical Journal* When the British Medical Association held its Annual Meeting at Cambridge in 1920 he was vice president of the Section of Physiology and Pharmacology He had joined the Association as long ago as 1875, and only resigned last October owing to advanced age and blindness

We regret to record the death of Dr RICHARD PRICHARD formerly medical officer of health for Cardiff rural district and medical officer of the Ely isolation hospital A student of the University of Glasgow he graduated M B C M in 1881 and proceeded M D two years later obtaining the Cambridge D P H in 1904 After qualification he was house surgeon at the Glasgow Royal Infirmary, resident medical officer at the Glasgow Maternity Hospital and for a time assistant physician to the City of Glasgow Fever Hospital Dr Prichard joined the British Medical Association in 1883, and served as president of

posts passed to untrained workers because of the scarcity of almoners The demand for almoners is now coming even more urgently from hospitals out of London than from those within the metropolitan area In London in 1935 there was a preponderance of appointments owing to the action of the London County Council which during that year opened an almoner's department in each of its general hospitals During 1936, of the fifty-nine posts of almoner or assistant almoner filled, twenty were in London and thirty-nine out of London It was also stated that although the majority of the appointments are still made by the voluntary hospitals the number of county and municipal health committees employing almoners is increasing Public health authorities enjoy considerable latitude as to the methods by which they work, and the duties of an almoner in a municipal or county hospital are varied to suit the requirements of the area The appointment of almoners to these hospitals is in many cases still in the experimental stage, but the institute considers that it has been proved that there is a place for hospital social service no less in the municipal or State hospital system than in the voluntary Some account was given to the meeting of the training required for the institute's certificate The public health and public assistance authorities of London, Liverpool, Leeds, Manchester Middlesex, and Surrey now admit students to their hospitals for part of their training Mention was made of the fact that the institute has become a tenant in the building of the British Medical Association, and the new accommodation has made possible an increase in its activities, particularly in regard to its library It was announced that Sir Farquhar Buzzard had consented to continue in office as president for a second period of three years

SCOTLAND

Glasgow Royal Infirmary

A new nurses' home is to be added to the Glasgow Royal Infirmary at a cost of over £100,000, which will be met by a contribution from the Lipton Trust, as a memorial to the late Sir Thomas Lipton The new home will contain 250 bedrooms, with the necessary rooms for reading, writing, private study, and recreation A tenement has been removed between Provand's Lordship and the Cathedral Halls, the site of the new building The annual report of the Infirmary shows that the number of patients treated in the wards last year was 18,416, with an average daily number resident of 849 In the out-patient department 119,914 patients received treatment, the attendances totalling 375,234 At the ophthalmic institution there were 752 in-patients and 15 890 out-patients The ordinary revenue fell short of expenditure by £24,459, but this deficit was met out of legacies and large donations amounting to £50,655 Subscriptions totalled £28,773, and there was an increase of over £2 000 in the subscriptions from organized employees and wage earners At the end of the year special sums amounting to £19,710 were received from the estates of Miss Margaret and Mr William M'Ghie to be devoted to cancer research, and these sums are to form the nucleus of a cancer research fund

Bicentenary of Edinburgh Royal Medical Society

In celebration of the bicentenary of Edinburgh Royal Medical Society, which was founded in 1737, a dinner was held in the North British Station Hotel, Edinburgh, on February 25 Dr A G Ross Lowdon, the senior president, took the chair and some 250 members of the society and guests attended, including Dr Robert Hutchison, Sir Auckland Geddes, Sir Thomas Holland (Principal of the University), Professor W T Ritchie (President of the Royal College of Physicians), and Mr Henry Wade (President of the Royal College of Surgeons) Dr Robert Hutchison who was the chief guest and a former president of the society, in submitting the toast of "The Royal Medical Society," said that if the half dozen obscure students to whom the society owed its birth could look down upon them from the Elysian fields they would be surprised to find that the seed which they had planted had grown into a tree which had braved the centuries All the chances had been against the survival of the seedling for the eighteenth century was a time when the foundation of medical and scientific societies was rife and the mortality among them was heavy so that few still existed to-day The Royal Medical Society, however, seemed to have been robust from the start and it had never looked back Before it reached its first half century a hall had been built the society had received a Royal Charter and a library had been started and in the middle of last century the society became possessed of its present house The speaker wondered why that society had succeeded when so many had failed, but he thought there were several reasons The society must have supplied a need which the University failed to provide, and had proved itself complementary to the education of the classrooms and Infirmary The medical student had to spend most of his time in absorbing facts and having the views of teachers pumped into him, and this society had provided him with a means for self-expression, if necessary with a heterodoxy which would be perilous in the examination hall Secondly, the society had been a great help to its members in the digestion of knowledge The medical student to-day was crammed with facts Nothing was so good for mental dyspepsia as open discussion and mental digestion, like its physical counterpart, proceeded best in public Argument and refutation, ridicule and laughter had always been provided by the Royal Medical Society in abundance The most important principle in the training of doctors was expressed in the old saying 'You can't have the terriers too soon at the rats' or in other words the student could not be brought too early into contact with patients, and this was stimulated by the Royal Medical Society The society had witnessed many changes in practical medicine including the disappearance of the polypharmacy and antiphlogistic treatment of the eighteenth and early nineteenth centuries and two of its old members, Lister and Simpson had inaugurated the advances of antisepsis and anaesthesia The society had survived many political troubles The present times held a threat to intellectual life which had been unknown in Europe for many generations, for in several countries free discussion and open expression of opinion even in scientific matters, were no longer tolerated, so that there was all the more need for societies to which intellectual freedom was the breath of life and where unrestrained individual opinion was not only tolerated but encouraged Dr Lowdon in reply, said that the society was constituted by a membership which ranged from their oldest living member, Sir James Crichton Browne who joined in 1858, to the last undergraduate who added his name to the roll He suggested that a telegram of warmest greetings should be sent to Sir James Speaking of present activities, he said that the numbers attending the meetings were greater than ever and last year sixty-six new members had joined while this year again they had enrolled sixty six new members up to date The bicentenary fund, which would be used for preservation and endowment of the library now amounted to £1 800, but more subscriptions would be needed The toast of "The Royal Colleges" was proposed by Dr R F Dawson and acknowledged by the Presidents of the two Colleges, and the toast of 'The Chairman" was given by Sir David Wilkie

On February 26 Sir Auckland Geddes a past president of the Royal Medical Society, read a dissertation explaining its title, "A Voice from the Grandstand Sir Auckland said that for many years his path had lain away from the profession of medicine, and he now felt like one of those pathetic figures who frequented grandstands at international football matches and who on the strength of precarious membership of school clubs forty years before, shouted advice and criticism to the national

the South Wales and Monmouthshire Branch in 1926–7 He had also filled the presidential chair of the Cardiff Medical Society and of the West of England and South Wales Branch of the Society of Medical Officers of Health Dr Prichard had contributed papers to the *Glasgow Medical Journal* and to *Public Health* At the funeral in Cardiff Cemetery on February 20 representatives were present on behalf of the British Medical Association, the Cardiff Royal Infirmary, the Cardiff Rural District Council, the University College of South Wales and Monmouthshire, and the Local Medical and Panel Committee, and many local practitioners from Cardiff and its neighbourhood

DAVID ROBERTSON MACGREGOR died from pneumonia after a short illness on February 4 He was born at Dunfermline in 1878 and took the B Sc degree of St Andrews University and the M B Ch B of Edinburgh in 1902 gaining the Freeland Barbour prize in his year He spent a year in Dundee Infirmary and two years as assistant to Dr Tuke of Dunfermline After a short period of practice in Fife he settled in Wallsend-on-Tyne in 1908, when that town was increasing in population with shipbuilding activity During the latter part of his residence there he was assistant to the Throat Nose, and Ear Hospital in Newcastle-upon-Tyne and finally gave up general practice in 1926 when he was appointed full surgeon He obtained the D L O in the same year He took a great interest in the hospital and devoted a good part of his time to it, and was also throat and ear surgeon to Newcastle General Hospital Mr Macgregor was surgeon to the education authorities of Jarrow and Wallsend, and was a part-time referee to the Ministry of Health His health had not been good for some years and following a poisoned hand three years ago he had never regained his vigour and strength He was conscientious and skilful in all his work, and a large number of practitioners will miss his kindly counsel in their throat and ear cases He had the red hair traditional to the Macgregors and his courtesy and kindliness was what one expects from the descendant of a Highland clan He had no family, and his wife and he were an ideal couple There was a large representation of the profession at his funeral at St Andrews cemetery on February 8, and Newcastle is all the poorer for his death

J H

The death occurred on February 21 at Worthing of Mr A J WILSON CHAMINGS, M B, F R C S, after a long illness Born in 1903, he was the only son of Mr A G Chamings who was for many years a much-respected official of the London County Council After being educated at Westminster School Wilson Chamings went to Cambridge in 1922, becoming a scholar of St Catherine's and graduating B A in 1925 In this year he entered St George's Hospital for his final medical studies while there he had a most distinguished career, and gained a large number of medical and surgical prizes before taking his Conjoint qualification in 1927 and his Cambridge M B in 1929 After holding three house appointments at St George's he became F R C S Eng in 1931 He then began to specialize in diseases of the ear, nose, and throat, and his outstanding ability and winning personality rapidly gained for him many important appointments He was at one time registrar at Golden Square and surgeon to the nose and throat department of the Paddington Green Children's Hospital, and senior ear, nose, and throat surgeon at the Princess Elizabeth Hospital for Children In 1932 he was appointed surgeon to the throat department of the Princess Beatrice Hospital, and then chief assistant at St Thomas's Hospital At the last two hospitals most of his work was done, and in a remarkably short time for so young a man his outstanding skill, conscientious work, and human kindliness were quickly recognized and rapidly began to make a name and practice for him In 1934 he recovered from a severe illness and started work again with his well known enthusiasm and devotion, and in 1935 was appointed consulting laryngologist at the Woolwich War Memorial Hospital A little over a year ago he was found to have contracted extensive pulmonary disease, and was given leave of absence from all his hospital appointments He received with great gratitude unstinted attention from numerous medical advisers, and throughout his long and tedious illness the devoted care of his parents Seldom has one so young crowded so much success into such a short life, or endeared himself to so many colleagues, friends, and patients, whose sympathies must surely help his parents in their loss

Professor HERMANN KUMMELL, the eminent German surgeon, whose death took place on February 21, was born at Corbach on May 22, 1852 After studying medicine at Marburg, Wurzburg and Strasbourg he qualified in Berlin in 1875 His first appointment was that of assistant to Max Schede, the director of the surgical department of the Friedrichshain Hospital, Berlin whom he followed to Hamburg, where Schede was made head of the surgical department of the new Eppendorf hospital In 1895, when Schede was appointed professor of surgery at Bonn, Kummell succeeded him, and in 1919 occupied the first chair of surgery in the new University of Hamburg, of which he was emeritus professor at the time of his death Kummell is best known for his description of the syndrome, called after him following spinal injury and consisting in pain in the neck intercostal neuralgia, motor disturbances in the legs, and a painful gibbosity of the spine His name is also associated with a tender point present in chronic appendicitis 1 to 2 cm below and to the right of the umbilicus His surgical activities however covered a much wider field In addition to being co-editor with Bier and Braun in their work on operative surgery, to which he contributed the articles on operations on the kidneys renal pelvis, and ureters he also wrote on injuries and diseases of the brain and spinal cord intestinal obstruction, gall-bladder surgery, injuries and diseases of the thorax and prostatic hypertrophy

We regret to record the death on February 23 at his residence on South Norwood Hill of Dr ROBERT LACHLAN PINKERTON at the age of 71 He had been for many years a very active member of the British Medical Association and had taken a keen interest in public affairs in Croydon He was educated in the University of Glasgow, where he graduated M A in 1884 and M B, C M four years later He proceeded M D in 1891 His earlier appointments included those of resident medical officer at the Surrey Dispensary and house physician at the City of London Hospital for Diseases of the Chest He was formerly surgeon to the Z Division of the Metropolitan Police, and civil medical officer to the Croydon War Hospital He was honorary medical referee to the British Home and Hospital for Incurables in Streatham Dr Pinkerton was elected a member of the British Medical Association in January 1894 and became one of the most prominent members of the Croydon Division He served as a member of its Executive Committee for many years and was chairman of the Division from 1927 to 1928 He devoted himself to its interests, and did a great deal of active work on its behalf He was also a justice of the peace for the county borough of Croydon

We regret to announce the death on February 28 of Dr FREDERIC WILSON STANSFIELD, T I S who was for many years a leading practitioner in Reading He was born at Todmorden Yorkshire on May 29, 1854, the son of Thomas Stansfield and after schooldays at East Hardwick, near Pontefract, went to study medicine at Owens College Manchester graduating M B, Ch B of the Victoria University in 1889 and proceeding M D in 1900 At Owens College he won the Platt exhibition in

inforces the views expressed by the Board in their circular and will for years to come help to shape the course and to guide the activities of all those who are interested in physical education The Chief Medical Officer's report deals fully with research organization, the training of teachers, and physical education in various types of schools including the special schools for mentally and physically defective children The Board also lays stress on rhythm and dance as a training in harmony of body, mind, and spirit

During the past year the number of public demonstrations of physical training organized by local education authorities increased They were attended by large numbers of people and gave parents and others a clearer understanding of what physical training means and of its influence on children and adolescents As a result parents have more willingly co operated with the school authorities in order to make the training effective Another important advantage is that teachers in public elementary schools and leaders in boys and girls clubs who have not had recent special training and have not attended refresher courses can learn much from a well arranged demonstration

Routine Medical Inspection

In recent years there has been much speculation and discussion among school medical officers on the possibility of improving the system of inspection and the Chief Medical Officer quotes at length from papers by Dr H L Cronk[1] (Hampshire) Dr Henry Herd (Manchester), and Dr G A Auden (Birmingham)

All these officers and many others hold the view that the three routine medical inspections carried out during the life of every public elementary school child should be reduced in number and some other type of medical supervision substituted Many medical officers however feel that the present system is not unsatisfactory and that any improvement should be effected by increasing rather than decreasing the number of routine age groups to be inspected Others hold that the present system ought to be supplemented by measures designed to remedy the weakness which allows intervals of several years between consecutive inspections There seems to be universal agreement that the routine medical inspection of all entrants must continue for the present and few would be found to advocate that inspection of leavers should be completely abolished Reformers are agreed on the necessity of frequent and periodic weighing and measuring of all the children

One of the most successful innovations of the century has been the nursery school movement and the Chief Medical Officer devotes a chapter to showing the beneficial effects it has had on the mind and body of the child upon parental responsibility and interest, upon the methods employed in infant schools and upon the home conditions especially where an overworked mother whose children are taken off her hands has time to keep abreast of her household duties The past year has seen many programmes of reform in the education and health of the child under 5 years The recent Circular 1444 urging all local education authorities to estimate the number of children who should be encouraged to attend school before the age of 5, has already brought an increase in the number of schemes for nursery schools or nursery classes Voluntary effort is most valuable in some areas, particularly where unemployment is rife and housing conditions are bad Work for young children in laying out a nursery school garden, repairing toys or making some of the furniture for a nursery school often carried out by unemployed parents has been most helpful to the teachers and has resulted in greater peace at home Nursery schools should be provided on new housing estates especially where social conditions are unduly poor many of the married women are employed or the gardens are unfenced and there is danger from traffic

Sir Arthur MacNalty gives interesting details about the growth of the orthopaedic service and recapitulates the essentials of an orthopaedic scheme The recent recrudescence of mortality from acute rheumatism seems now to have abated but the disease has strong claims on the special attention of the school medical service for the second half of school life is the time of its greatest incidence and mortality In 1934 acute *rheumatic infection* was responsible for 16 per cent of all deaths between 10 and 15 A synopsis of a complete rheumatism scheme is the subject of a special chapter The report also contains a valuable essay on the examination of children suspected of mental deficiency, founded on the experience of officers of the Board

INTERNATIONAL HOSPITAL CONGRESS
PARIS, JULY, 1937

The next International Hospital Congress will be held in Paris from July 6th to 11th 1937 in the Arts and Professions Building 9 bis Avenue d'Iena close to the World Exhibition which is taking place in Paris next summer An influential organizing committee has been formed under the patronage of the French Minister of Health and the services of M Albert Chenevier secretary of the Public Assistance Administration in Paris have been secured as honorary secretary of the Congress Dr Rene Sand Dr W Alter and M Sarraz Bournet have consented to act with the committee on behalf of the International Hospital Association

A varied programme of lectures and discussions has been prepared including French German Italian and English speakers on the national planning of hospital services Other subjects to be dealt with are (1) hospital visiting (2) the rights of the hospital in regard to case histories of patients (3) general nursing problems (4) hospital finance and publicity (5) the hospitalization of mental cases

Arrangements for Visits

Arrangements are being made to organize a visit of several days duration to the Lyons district for the week immediately preceding the Congress The hospitals of Lyons the sanatoria of the Alps and the hospices of Beaune would be among those visited An alternative tour in another part of France is also under consideration With a graceful gesture the regional hospital unions composing the French Hospital Federation have indicated their wish to provide official receptions for foreign delegates at the frontier towns through which they will enter France to attend the Congress in order that they may receive a welcome as soon as they set foot on French soil This courtesy is a token of the thought and consideration which are being given by the Federation to all the arrangements it is making for the comfort and interest of the delegates During the Congress provision will be made for afternoon visits of two kinds one of a technical nature to large hospitals the cancer hospital at Villejuif etc and the other of a sight seeing nature mainly for the benefit of those who accompany the members of the Congress but are not themselves hospital workers After the Congress it is hoped to arrange for one day visits from Paris and back again to parts of France within easy distance of the capital (Rheims the wine vaults of Champagne etc)

Owing to the present variable state of the exchange it has not been possible yet to fix the fee for attending the Congress but 100 francs has been suggested This would entitle visitors to a very considerable concession in fares on all French railways during a period of three months and probably also to free entrance into the Paris World Exhibition

A good attendance at the Congress is expected from America and tentative arrangements have already been made with French steamship lines to run special itineraries which will give oversea visitors an opportunity of seeing other parts of France and Europe A warm welcome will be given to any delegates who pass through the United Kingdom on their

way to Paris, and arrangements will gladly be made for them to visit hospitals and places of interest if they care to notify the place and date of their arrival to the general secretary of the International Hospital Association, Mr Sydney Lamb, 87, Lord Street, Liverpool, 2

STILLBIRTHS AND NEONATAL MORTALITY

[FROM A MEDICAL CORRESPONDENT IN BERLIN]

A Viennese physician and statistician, S Peller, has recently devoted an interesting work to the subject, "Death in Child Birth" (*Der Geburtstod—Mutter und Kind*—publishers, Franz Deuticke, Vienna, 1936) Neonatal mortality as defined by Peller is the mortality of the first week of life, and he again subdivides it into mortality of first, second, etc, days He does not, however, content himself with a study of neonatal mortality, but brings into consideration stillbirths, which approximate to about 3 per cent of live births, which, when infant mortality in most civilized countries is not more than 4 to 10 per cent of live births, is a substantial number Peller's studies are of special importance because his careful analysis suggests how stillbirths and neonatal mortality, which so far has had hardly any share in the reduction of infant mortality, may possibly be decreased The importance of this is evident It cannot be without interest to consider "whether of a million born some seventy thousand or only ten to fifteen thousand should perish on the threshold of life' Peller reaches the conclusion that the stillbirth and neonatal rates, which together destroy from 6 to 8 per cent of all births, even in the countries where infant mortality is at a minimum, are not reducible by medical or therapeutic means

Some Viennese Figures

Even the increase of lying-in homes since the war and better gynaecological technique have been without effect, but, on the other hand, Peller produces Viennese statistics to the effect that the care of the mother during pregnancy, her relief from the necessity of industrial or household work, is of the greatest importance In Vienna there has long existed the Institution Des Schwangereninternates, which, originally a charitable foundation of the eighteenth century dealing with unmarried women, has later, with the increase of institutionalism, received many married women The children of those admitted some weeks before the confinement (designated in the table below as Hausschwangere) have much lower stillbirth and neonatal mortality rates than other women, whether the pregnancies are legitimate or illegitimate For every 100 births in the undermentioned groups the percentages are as follows

Vienna 1927–9 Mortality (Total Stillbirths plus Mortality First Week of Life)

	Illegitimate Children	Legitimate Children
Hausschwangere	3 9	2 6
Nichthausschwangere	10 2	8 8

The contrast is very striking, and the relative improvement in both groups of civil states is about the same Children of the Hausschwangere on the average are taller and heavier at birth than the children of the Nichthausschwangere, who before their confinement have continued in their unfavourable social environment Hence the conclusion is suggested that this great difference depends in the first place on better physical development "Neither in that paradise for infants, New Zealand, nor in Australia nor in Holland nor in Sweden, can the sum of stillbirths and neonatal deaths be brought below 3 2 per cent for illegitimate and 1 6 per cent for legitimate births It would seem that neither civil condition, race constitution nor relative increase in the number of first-born is a decisive factor

None of the unfavourable factors seem to be of such importance as not to be overcome by providing for pregnant woman a release from unfavourable environmental conditions some weeks before delivery Peller holds that to demand that the stillbirth rate should be less than 1 per cent and neonatal mortality less than 0 5 per cent is not Utopian The way to reach this result is not more obscure, indeed he thinks it is less obscure than the path leading to the reduction of later infant mortality to 2 to 3 per cent This way lies through the erection of institutions for the reception of the majority of pregnant women and, of course, it raises financial questions But even should this path prove closed a recognition of the real factors of mortality may lead in other ways to improvement

Maternal Mortality in Germany

Peller also considers the question of maternal mortality Although the rate of mortality of women in most age groups is lower than that for men in the age of reproduction this had in the past not been the case in German experience But in the latest German life table, based on the three years 1932–4 a change has occurred, inasmuch as for ages 30–35 and 35–40, which in the 1924-6 table showed a higher mortality for women, now show a lower mortality One would be inclined to attribute this to a decrease of birth rate Unfortunately the reasons why a number of women perish are not clear The absolute number may not be large, but one has to recall our uncertain information respecting abortions, possibly one of the main problems of maternal mortality Peller estimates that in Berlin, 1922–5, 1,041 deaths were attributed to the sequelae of normal pregnancy and labour, 1,827 to effects of abortion, in 1926–9 the corresponding numbers are 971 and 922, with approximately equal number of births in the two periods Abortions, therefore, claimed a particularly large number of victims in the years following the war, and fell by approximately half in the second period, while mortality following birth at term changed very little, from 5 8 to 5 3 per 1,000 births

These specific components of maternal mortality naturally vary in different countries It has to be borne in mind that the Berlin practice of distinguishing between deaths due to normal pregnancy and abortion is not universal According to Peller, in Paris in 1925–8 the maternal mortality was 3 9 per 1,000, in Vienna in 1925–9 6 8, and in Budapest, 1925–8, 7 5 It is rather remarkable that in Leningrad and Moscow the rates are lower than in all other great cities Peller suggests that the differences may reflect different attitudes of gynaecologists towards medical indications for terminating pregnancies, and explains in this way a lower rate of maternal mortality in London than in other European capitals

---

M Chiray, G Albot, and M Deparis (*Paris med*, May 16th, 1936, p 423) state that the clinical symptoms of tuberculous hepatitis are often confusing and misleading When tuberculosis invades the digestive tract or peritoneal serosae the galactosuric concentrations reveal the presence or absence of a fatty or follicular tuberculous hepatitis, and are an important prognostic sign A persistently high galactosuria is an early indication of a degenerative tuberculosis of the liver, a condition which sometimes complicates and aggravates certain pulmonary, genital, and other forms of tuberculosis Three cases are described which demonstrate the value of this test

E Wehefritz and E Gierhake (*Zbl Gynak* November 14th, 1936, p 2711) found a marked increase of uterine hypoplasia during the last five years Whereas before the war uterine hypoplasia was found in about 1 per cent of cases, the percentage went up to 2 in 1931 and to 3 3 in 1935 The increase of the proportion of uterine hypoplasia was particularly pronounced in women born during the war The authors explain this increase by the quantitative and qualitative deficiencies of the nutrition during the war years, particularly in vitamins A and E The developmental injury remained latent during childhood, but became apparent in the adult

physiology After settling in practice at Reading he was appointed public vaccinator for the Nos 1, 2 and 3 districts, and medical officer for No 2 district He obtained the Cambridge D P H in 1893, and the subject of his M D thesis was the distribution and classification of cancer and phthisis in the borough of Reading during 1886–98 Dr Stansfield joined the British Medical Association forty years ago, was chairman of the Reading Division in 1922–5, was president of the Oxford and Reading Branch in 1923–4, and had also been president of the Reading Pathological Society He was a keen botanist and a prominent member of the British Pteridological Society He edited the *British Fern Gazette* and contributed scientific papers on ferns to the *Journal of the Linnean Society*

South London has lost an outstanding member of the profession in Dr WILLIAM DENISON WIGGINS for twenty five years medical superintendent of St Alfege's Hospital Greenwich Born in 1873 at Watlington, he was educated at Magdalen College School Oxford and St Mary's Hospital His first post was that of assistant medical officer at Fulham Infirmary and he moved a year later to the Greenwich Infirmary where his life work was done At the time of his appointment the surgical work at the infirmaries was rather rudimentary, but by his firmness and tact Dr Wiggins was able to get good surgical quarters and operating rooms He had considerable technical skill as an operator and his opinion was much in request for surgical cases in the district outside the hospital He practically organized from the beginning the nursing school upon modern lines His lectures to the nurses were highly appreciated for their insistence upon practical and intelligent ward work In 1904 he published a handbook of midwifery for nurses and gave many refresher courses for practising midwives He reported clinical material from time to time in the *British Medical Journal*—a case of acute intestinal obstruction in 1897 and a case of ulcerative endocarditis with perforation of ventricle in 1898 He was a man of many interests A good all round sportsman, he was a member of the old Blackheath Golf Club A pigeon fancier, he raced his pigeons with the best and played an excellent hand at bridge He was a Mason and held the office of Grand Master of his Lodge No account of him would be complete that left out his interest in curios of all sorts He had a fine collection of old china and furniture and was regularly to be seen at the Caledonian market He leaves a son, who is a student at Guy's Hospital, and one daughter

L P

The death of Dr JULES FREDERICK REY was recorded in our issue of February 20 (p 422) and we have now received the following appreciation from Professor J A Ryle His end came swiftly after many years of ill health patiently and cheerfully borne, and after two years of disability so pronounced that for most men life might have seemed no longer to retain any virtue or advantage From Rey however *the limitation or crippling* of one faculty after another brought no complaint but only the same courageous acceptance and the same unaltered determination to enjoy to the full what still remained for him It was a rare privilege for his professional colleagues to be called to see him in one or other of his complicating illnesses and to discover always smiles in place of despondency and never to hear a whisper of defeat Reading became difficult in the last eighteen months of his life and his wife used to read aloud to him but he still insisted each week on perusing the *B M J* for himself A friend writing an appreciation of him in one of the daily papers spoke of his amazing pluck which seemed almost abnormal It was abnormal like all outstanding spiritual courage and for those who nursed and attended him in his own home it was a constant source of inspiration and pride Rey was born at Ashford in Middlesex on October 16 1880 the youngest son of the well known engineer Jules Rey He was educated at Boulogne and Guy's Hospital and qualified in 1904 Inheritance and example may have determined some of his special interests for his particular enthusiasm in medicine was always centred in x ray work and electrotherapy At the West Hants Hospital as a young man he was the first to take stereoscopic x ray photographs He practised first in Cardiff and after his marriage in 1910 at Bognor He was much beloved by his patients, and his family circle was one of the happiest One of the original members of the staff of the Bognor Regis War Memorial Hospital, he was partly instrumental in obtaining a generous gift for the hospital from a patient, and characteristically, a last request was for gifts for Guy's Hospital rather than wreaths for his funeral Among his hobbies he numbered carpentry engraving gardening and photography but his greatest hobby and interest was always his work He leaves a widow and a daughter and a son now at Guy's to succeed him in his profession

The following well known foreign medical men have recently died Dr FRANCESCO MAGGI director of the ophthalmological clinic at Milan Dr PAUL LEGENDRE a well known Paris physician member of the Academie de Medecine Dr WILLIAM C BUCHANAN, professor of bacteriology in the University of Cincinnati and Dr HENRI DAUSSET director of the Institute of Physiology at the Hotel Dieu Paris

Universities and Colleges

UNIVERSITY OF OXFORD

The result of the Oxford University by election for the vacant seat in Parliament was announced on February 27 Sir Arthur Salter (Ind) was returned with a poll of 7 580 Sir E Farquhar Buzzard Bt M D (C) received 3,917 votes and Professor F A Lindemann (I C) 3 608 votes

At a congregation held on February 27 the following medical degrees were conferred

D M—*W H Owles, D H Brinton*

UNIVERSITY OF CAMBRIDGE

At the Congregation held on February 20 the degree of Master of Arts was conferred on the following demonstrators in anatomy J S Baxter M S M B B Ch Belf D V Davies M B B S Lond M T Greig M B Ch B B Sc (N Z) and W R M Morton M D Belf

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Museum Demonstrations

A course of museum demonstrations in the theatre of the College commenced on March 1 when Mr R Davies Colley showed specimens illustrating diseases of the thyroid gland To day (Friday March 5) Mr A J E Cave will speak on anatomy of the knee joint on March 12 on the anatomy of nasal fossae and sinuses and on March 19 on the anatomy of the trigeminal nerve On March 8 Mr L W Proger will show recent additions to the museum and on March 15 Dr C Keith Simpson will speak on the pathology of the adrenal gland in relation to sudden death All the demonstrations commence at 5 p m and are open to advanced students and medical practitioners.

SOCIETY OF APOTHECARIES OF LONDON

The following candidates have passed in the subjects indicated

SURGERY—E S Dismorr B T Jones J E R Palmer B A R Pitt A W B Perren J R Rocyn Jone R L Williams

MEDICINE—J D Anderson R F B Bennett H A Bhuttacharji S M M Niall G G Sahasrabuddhe R G Stitt G Theophilus

Two Specialist Publications of the B.M.A.

★ ARCHIVES OF DISEASE IN CHILDHOOD

This specialist publication covering the whole field of paediatrics is issued bi monthly and contains original articles of great importance to those who are interested in this particular branch of medical practice

Archives of Disease n Childhood is printed on high quality paper which lends itself admirably to the reproduction of photographs illustrating the articles including radiographs

Yearly (Six Numbers), 25/- or 4/6 per copy

The Journal of NEUROLOGY AND PSYCHOPATHOLOGY

The specialist in the neurological and allied branches of medical science will find in this quarterly publication articles contributed by the leaders of international thought regarding all kinds of mental conditions Abstracts from world publications in the same field are also included

The Journal of Neurology and Psychopatho logy is printed in such a way as to enable the fullest benefit to be derived from the various illustrations in its pages

Subscription 30/- per annum or 8/6 per copy

Obtainable from B.M.A. House, Tavistock Square, London, W.C.1

Medico-Legal

BLOOD GROUPS IN CRIMINAL IDENTIFICATION

A recent motoring case tried at the Central Criminal Court gave an interesting illustration of the manner in which evidence of blood groups may supplement other evidence of identification A motorist struck and killed a woman and drove on The police were able to trace the car, and found it at the premises of the accused, with the offside back wheel covered with blood The accused denied before the magistrates, but afterwards admitted, that it was his car Dr G Roche Lynch gave evidence that the wheel and hub cap had become blood-stained while the car was moving with blood of the O group At one spot on the rim there was a small quantity of woollen material which exactly tallied with the wool of the jumper worn by the woman, and her blood was also of group O The evidence, therefore, was quite sufficient without the correspondence of the groups, and indeed this group is common to about half the population Nevertheless it is easy to imagine a case in which there would be no distinctive woollen material caught up by the car but merely a quantity of AB blood on the wheel corresponding to a deceased of group AB—a group found in only 3 per cent of the population The legal value of the blood groups is only beginning to be understood in this country —perhaps because evidence based on them is always bound to be negative and eliminatory rather than positive Nevertheless they are a valuable stand-by in the investigation of crimes of violence, as well as in the determination of non-paternity, as Drs Harley and Roche Lynch showed in a recent issue of the *British Medical Journal* (January 23, p 163)

Medical Notes in Parliament

On March 2 the National Health Insurance Act (Amendment) Bill passed through committee in the House of Lords The operative clause of the Bill runs thus "Subsection (2) of Section forty-one of the National Health Insurance Act, 1936 (which provides for prohibiting arrangements for the dispensing of medicines being made with persons other than persons who are entitled under the Pharmacy and Poisons Acts, 1852 to 1933, to use the title chemist and druggist) shall have effect, and shall be deemed always to have had effect, as if for the words 'entitled under the Pharmacy and Poisons Acts, 1852 to 1933, to use the title chemist and druggist' there were therein substituted the words 'registered pharmacists or authorized sellers of poisons within the meaning of the Pharmacy and Poisons Act, 1933'"

The House of Commons this week discussed foreign affairs and made progress with the Defence Loans Bill The Deaf Children (School Attendance) Bill was read a third time by the Commons on February 24 On March 1 the Lords amendments to the Regency Bill were agreed to, and the Geneva Convention Bill was read a third time The Local Government (Financial Provisions) Bill passed through committee Mr Elliot on March 1 presented the Local Government (Financial Provisions) (Scotland) Bill, which amends Part III of the Local Government (Scotland) Act, 1929, and repeals, so far as relates to Scotland, Section 45 of the Unemployment Assistance Act, 1934

The Conservative Party Committee on Nutrition met on March 2, and was addressed by Dr Nash, medical officer of health for Heston and Hounslow Dr Nash gave a demonstration of cheap foodstuffs which are readily available

The Parliamentary Medical Committee arranged to meet on March 4 and hear an address from Dr Bousfield on diphtheria immunization

Pasteurization of Milk

Mr ROBERT MORRISON asked the Minister of Health on February 5 whether, in view of the evidence contained in the annual report of the chief medical officer of his Department for 1935 of serious outbreaks of scarlet fever solely due to the sale of raw milk, he would consider the making of regulations providing for the compulsory pasteurization of all milk

Sir KINGSLEY WOOD replied that he had no power to make such regulations

Health of Ex-Service Men

On February 22 Captain COBB asked the Minister of Pensions whether he was aware that many ex-Service men were said to be becoming prematurely aged or incapacitated as a result of the general after effects of their war service and should receive pension for their condition, and whether he would make a statement upon the attitude of his Department to such cases and the possibility of pensions being granted

Mr H RAMSBOTHAM said his attention had been drawn to certain statements to that effect, which might tend to rouse hopes that could only be disappointed He had no power to award compensation for disablement other than such as resulted from specific injuries or ailments which were established to be traceable to war service Consideration of other conditions not so established would be the concern of other services Inquiry into the matter had not disclosed any evidence from general medical experience which would support the suggestion that there was greater likelihood of premature incapacity among ex-Service men than in other sections of the civil community of similar age Inquiries were being pursued by the British Legion and other ex-Service men's associations the results of which would be laid before the Minister or Ministers whose Departments might be concerned

Supplementary Estimate for Agricultural Education and Research

The House of Commons, in Committee of Supply on February 22, discussed a Supplementary Estimate for salaries and expenses of the Ministry of Agriculture and Fisheries and grants in respect of agricultural education and research Mr W S MORRISON said that there was a small sum of £750 for grants in-aid of annual expenditure on colleges and institutions The whole question of veterinary education was being investigated by a committee, and until it had reported they would not properly know what were the requirements for the future conduct of this vital part of education The sum was for the maintenance of the Veterinary College as it was at present, pending the receipt of the report of the committee and a detailed scheme of veterinary education The additional sum of £48,300 for diseases of animals included £40 000 on grants for compensation in respect of foot and mouth disease There was no outbreak of the disease at all in the first five months of the financial year, but between September 1 and the date of the submission of the Estimate there were sixty five outbreaks In this case the Ministry was estimating for expenditure in this year on any outbreaks which might occur before March 31st There had been an increase on the item with regard to cattle slaughtered under the Tuberculosis Orders This was due to the increasing vigilance of the local authorities and the farmers in reporting disease in their herds and making use of the provisions for its elimination That was a healthy symptom It was also due to the fact that in many cases animals were condemned at an earlier age when they were normally more valuable That might also be taken as a healthy symptom, showing that both farmers and local authorities were taking their duties

RHEUMATIC cases find soothing comfort in 'Viyella' Sheets. *Letters of appreciation also from chronic invalids and the aged*

Those who have recently made the acquaintance of 'Viyella' Sheets are warm in their praise From many parts of the country come letters telling of the comfort 'Viyella' Sheets have brought to sufferers from rheumatic complaints, to chronic invalids, the aged, and others who dread the chill of linen or cotton sheets Many members of the Medical Profession have shown their confidence in 'Viyella' Sheets by recommending them to their patients, and have even gone so far as to write personal letters endorsing the claims that have been made Now, when the resistance of those who suffer from chronic illness is lower, the 'kindly comfort and sweet relief' of 'Viyella' Sheets will be doubly welcome

NATURAL WARMTH AND SOOTHING COMFORT

'Viyella' Sheets have the smooth touch of linen but the warm feel of wool They are porous and light as down, absorb perspiration and are absolutely non irritant They bring the *natural* warmth and soothing comfort which induces sleep No amount of washing year in, year out, will spoil their freshness

If you have not already received detailed particulars of 'Viyella' Sheets we shall be pleased to send these together with samples of the fabric Inquiries should be addressed to William Hollins & Co Ltd (Medical Inquiries) Viyella House Nottingham

* EXTRACT FROM THE 'PRACTITIONER' *

Most practitioners have patients—sufferers from rheumatism, rheumatoid arthritis, sciatica, nephritis, pneumonia, etc—whom they know would be much better off sleeping between blankets, but the patients frequently dislike the irritation and the weight of the blankets In view of this, we have been asked to make a test of 'Viyella' Sheets, as being the happy medium between the heavy blanket and the cold sheet There was no sense of weight or irritation, and there was an unusual cosiness in getting into bed between 'Viyella' Sheets The feeling of soothing and comfort which ensued ought to do good to invalids and convalescents

'Viyella' Sheets

seriously in this matter and were making progress in dealing with this vital problem of cleaning up our herds The £600 *provided for research work under the Diseases of Fish Bill* was to pay a man to test fish to see whether or not they were suffering from furunculosis

Replying to Mr Short Mr MORRISON said that Sir Frederick Hobday had retired from the Royal Veterinary College because of age His distinguished services had been fully appreciated The research into foot and mouth disease had been carried forward with the utmost energy and some *of the results obtained had been very creditable*

The vote was agreed to

Bedeaux System in Factories

On February 23 Mr HARDIE asked the Secretary of State for War whether the Bedeaux system or the Taylor system was employed in any of the works or factories receiving contracts from his Department

Mr DUFF COOPER said he had no precise information regarding the extent to which these systems were employed by War Department contractors but he understood that a number of contractors made use of the Bedeaux system or some modification of it

Mr HARDIE asked if *Mr Duff Cooper understood that* destruction of the nervous system which took place among workers who were so treated and if he would take steps now to save the nervous system of persons whom he might require before long so that he might have these men with completely unbroken nerves instead of men with nerves shattered by a stupid system

No reply was given

Exchequer Aid to Local Authorities

The second reading of the Local (Financial Provisions) Bill was moved in the House of Commons by Sir KINGSLEY WOOD on February 24 He said this was the first revision of grants made under the Local Government Act 1929 The Act had proved a successful measure for local government and social reform and no one desired to revert to the old percentage system of assistance to local authorities The block grant which had replaced that system had assured for local authorities a considerable pool for expansion of their services and administration had been emancipated from unnecessary interference by State Departments In 1933 a further sum had been added to the pool At that time anxiety was expressed whether the standards of the health services would be maintained under the new system but it would not now be gainsaid that much had been achieved since 1929 in securing that the services of local authorities reached a higher standard Since that year there had been considerable development in rural sewerage and water schemes and loans sanctioned for rural works and sewage disposal had grown from £292 000 in 1932–3 to £1 000 000 in 1935–6 In 1929 fears were expressed concerning the maternity and child welfare services In 1929–30—the last year of percentage grants—expenditure on maternity and child welfare in England and Wales was £2 400 000 In 1934–5 this expenditure had risen by 25 per cent The expansion of all services during this period was 9 per cent The present Bill would fix the annual general Exchequer contribution at £46 172 000 for the third fixed grant period The net money addition annually for the third grant period was £2 250 000 and local authorities were also to be relieved of an annual expenditure of £2 750 000 The Bill was designed to improve the method of distribution so that the grants should be allocated still further according to need and special and necessitous areas should obtain substantial assistance

Mr ARTHUR GREENWOOD criticized the distribution of the grant and held that more money should go to struggling industrial towns The poorest towns had more people to support He quoted from a memorandum sent to the Prime Minister from the Children Minimum Council which stated that out of sixteen maternity and child welfare authorities of which the council have particulars for 1935 and where the unemployment rate was over 25 per cent in September, 1935 six gave no free milk to children between 3 and 5 years old four gave no free milk between the ages of 1 and 5 and one gave no free milk to expectant mothers More heroic measures Mr Greenwood said were required than the present Bill or else the deepening poverty in the distressed areas would affect the physique and the morale of the people there

Sir FRANCIS FREMANTLE said no possible extension of the formula would really cover the needs of the distressed areas which would have to be dealt with by other means Since 1929 the country had had seven years experience of the block grant system and he tested its results by one phase of social service—maternity and child welfare It was said in 1929 that the percentage grant would sterilize the whole movement and do away with the incentive to progress Actually in 1922 infant deaths per 1 000 births numbered 77 in 1929 they were 74 and in the last seven years they had fallen to 57 Taking infants in the first three months of life the mortality was 47 per 1 000 in 1922 44 in 1929 and in the next seven years it fell to 39 There was no reduction in the figure for the second three months of life during the seven years before the 1929 Act came into force but in the subsequent seven years the figure fell from 11 to 8 In the last half of the first year of life there was no reduction in mortality in the seven years before the Act came into operation but in the last seven years there had been a reduction from 19 to 10 deaths per 1 000 Similarly mortality in the second year of life had been reduced from 24 to 10 per 1 000 in the third year from 10 to 5 per 1 000 in the fourth year from 6 to 3 per 1 000 and in the fifth year from 4 to 3 per 1 000 That was a thermometer of public health

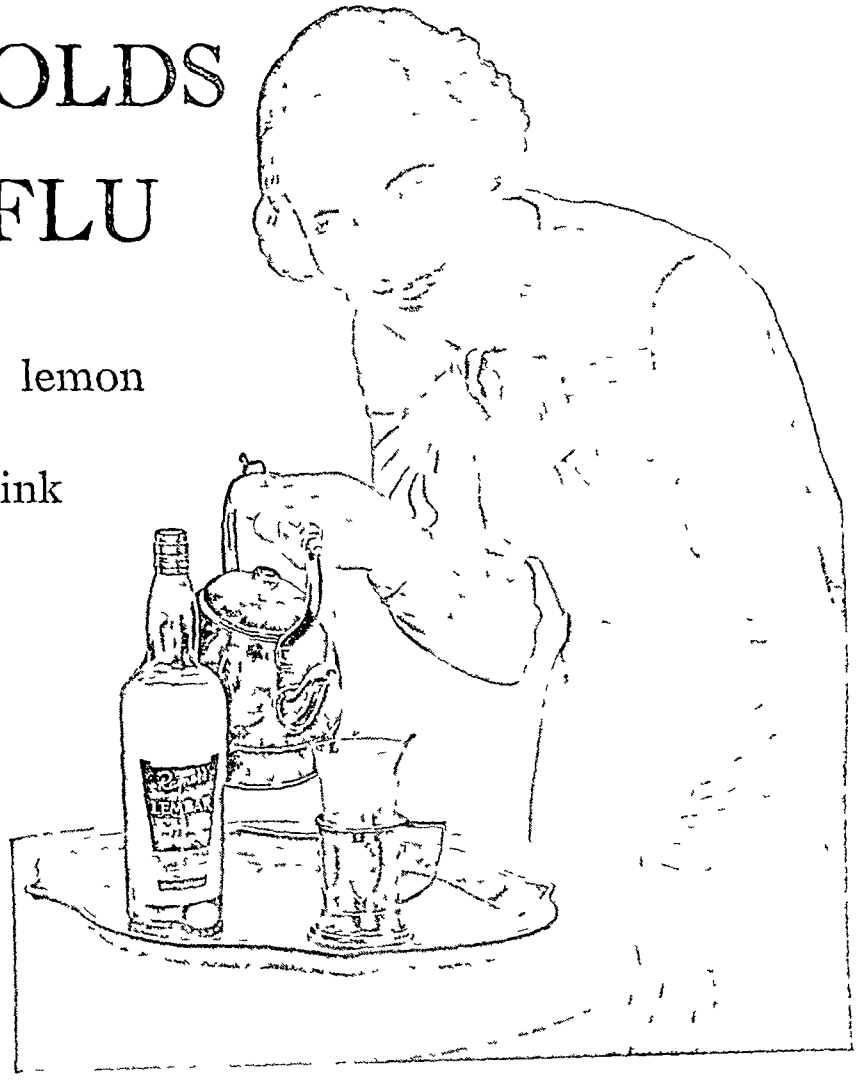
Mr ROBERT HUDSON replied to the debate and the Bill was read a second time without a division A financial resolution authorizing the necessary expenditure under the Bill was immediately passed without discussion

Approved Societies' Additional Benefits

Mr JAMES GRIFFITHS asked on February 25 if the Minister of Health knew that the disparity between the additional benefits provided by approved societies under the National Health Insurance Acts had a serious effect upon the position of the poorer societies that members sought to be transferred to the richer societies that provided higher additional benefits and whether he proposed to take steps to co ordinate the administration of the Acts to provide uniform benefits for uniform contributions Sir KINGSLEY WOOD replied that he was aware of these considerations but *statutory provision* was already made for the protection of any society against transfer of membership due to unfavourable valuation results Equalization of benefits would be incompatible with the retention of the approved society system of administration and he saw no sufficient reason for altering that system at the present time

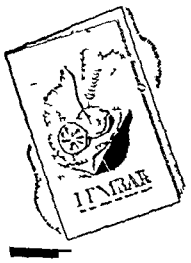
Factories Bill in Committee

Consideration of the Factories Bill by a Standing Committee of the House of Commons began on February 25 On Part I—*Health (General Provisions)*—discussion began on Clause 1 (Cleanliness)



Mr RHYS DAVIES moved an amendment to provide that the cleaning of the floor in every workroom at least once in every week as the Bill directed should be done when work was not going on in the workroom Mr GEOFFREY LLOYD *said the clause had* been framed to give the Home Office control over methods of cleaning other than washing for the purpose of preventing objectionable means being used. Factory inspectors would take the view that if clouds of dust were raised to the annoyance and inconvenience to the work people that was an unsuitable method of cleaning

Mr HOLLINS said that in the pottery industry special regulations provided that cleaning should be done outside the working hours because of the danger of dust The Bill ought to make provision to cover cases where the dust was of dangerous character Mr LLOYD said an amendment later on would enable stringent provisions to be enforced by the Home Secretary in food factories The Minister of Health had in



FOR COLDS AND 'FLU

This delicious lemon and barley drink

hot or cold

The bother of making barley water—the squeezing of lemons the repeated boiling and draining of the barley—is a real trouble in the home made even busier than usual by sickness Yet Lemon and Barley is very necessary in all febrile conditions *This is where Lembar helps the medical man* It is as effective for colds and influenza as home made and quite as delicious Made from finest lemons good Scotch barley sugar and medicinal glucose *all ready to drink* In all conditions of sore throat Lembar can be safely prescribed Although rich in lemon juice it is so soothing that it can be drunk in plentiful quantities with comfort Caloric value and potential alkalinity excellent Strength and richness make Lembar specially economical—a 2/ bottle makes at least one gallon of lemon and barley drink

preparation a Bill dealing particularly with conditions in food factories and the point would be adequately dealt with thereby The provisions in the clause under discussion were general and without prejudice to the powers of the Home Secretary to make special regulations such as those mentioned by Mr Hollins for health and safety in dangerous trades

An amendment moved by Mr GRAHAM WHITE, to authorize the use of other suitable detergent" instead of soap was accepted Clause 1, with a further small amendment was then carried

On Clause 2 (Overcrowding) Mr RHYS DAVIES moved to leave out a proviso permitting a lower standard of cubic space per worker for five years after the passing of the Bill and thereafter where effective mechanical ventilation was provided at the expiry of that period The Bill laid down that in respect of every workman employed in the factory there must be a minimum space of 400 cubic feet The Bill proceeded to qualify that in a way which weakened the purpose of the clause Amendments tabled by Sir John Simon would in part remedy this He invited Mr Lloyd to explain what was meant by these amendments

Mr LLOYD said there was no other way to meet the varying conditions of British industries except by these elastic powers These provisions had grown up under the inspiration of factory inspectors and worked well, so the Government was not making any general departure from the old system under this Bill In a certain number of cases, mainly of small concerns particularly in the clothing trade, an increase of the minimum cubic space per head from 250 to 400 cubic feet would involve hardship not only on the occupiers but on the workpeople These concerns existed in crowded areas of big cities, and the new standard of 400 cubic feet if immediately imposed would force the enterprises to close down or to discharge the people who could not be accommodated under the new provisions The Bill gave an elastic provision in view of the fact that modern research on ventilating and overcrowding had found that movement and circulation of air were more important than the gross cubic feet of space available for individual workers The Home Office recognized that it was desirable to lay down conditions as soon as possible, and would therefore put down amendments in terms practically the same as those proposed by Mr Rhys Davies, and would also take power to bring the condition about mechanical ventilation into operation before the end of the five years in special cases

Mr ALFRED SHORT said the Labour Party was not satisfied with the provision of 400 cubic feet, and he had an amendment down to increase the cubic air space to 500 cubic feet Mr LLOYD said he did not think this increase reasonable It was not intended that the provision authorizing a small air space where mechanical ventilation was provided should be interpreted as referring only to ventilation produced directly by fans He pointed out that the International Labour Office standard was 350 cubic feet, or less than that in the Bill Mr RHYS DAVIES said that from 1875 a minimum of 300 cubic feet had been compulsorily in common lodging-houses Mechanical ventilation was only a second-best safeguard Mr Rhys Davies then withdrew his amendment, and said that the Labour Opposition would reconsider its attitude on the whole question during the report stage

The committee then adjourned the discussion of the Bill until March 2

Public Gas-proof Shelters

On March 1 Mr WILSON asked the Home Secretary what plans had been made by the Air Raid Precautions Department for the provision of gas proof shelters for public use equipped with filtration units and pumps Mr GEOFFREY LLOYD replied that it was proposed that so far as possible members of the public should remain indoors in a part of their home or place of work which had been adapted as a refuge in accordance with instructions which would be issued The provision of refuges for persons caught in the street when a raid was imminent was under consideration but while the equipment required in public refuges must depend on the nature of the premises employed for the purpose it was considered that if ordinary safeguards were employed the installation of filtration plant would not be required

Mr WILSON also asked the Home Secretary if the Air Raid Precautions Department could state by what test in its opinion, ordinary people could detect the presence of mustard gas or lewisite without having to breathe it Mr LLOYD said that mustard gas and lewisite could be detected by visual observation or by sense of smell which might suffice to give warning without any harmful effect Arrangements would be made for the detection of poison gas as part of the air raid precautions organization, and if members of the public were in danger of inhaling poisonous vapours every effort would be made to warn them of the presence of gas before they had to ascertain it for themselves

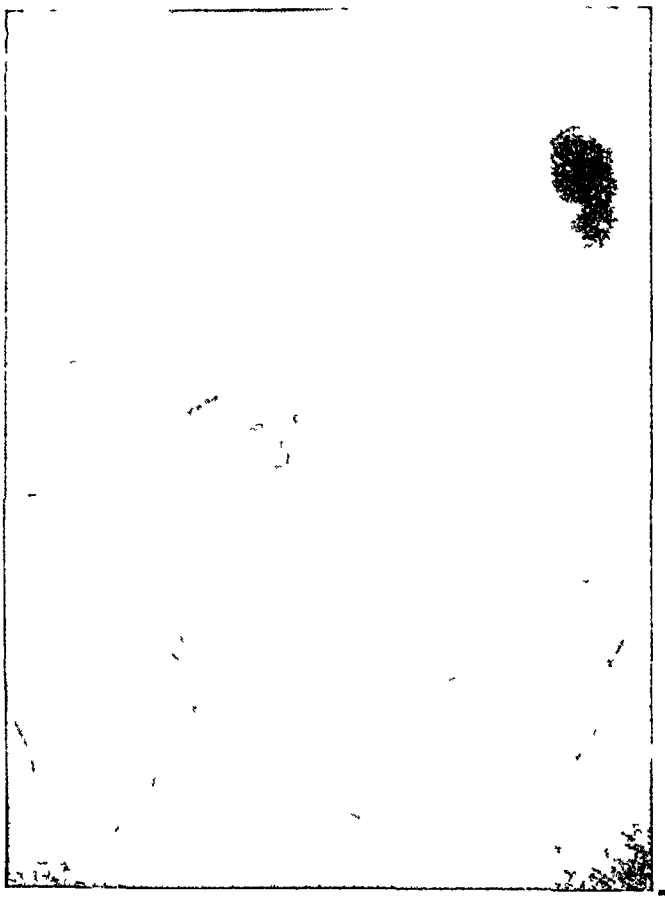
Mr LLOYD, replying to Mr Parker on March 1, said that an investigation into the observations of the Cambridge Scientists Anti war Group was carried out by the Chemical Defence Research Department and the Chemical Defence Research Committee

Medical Services in Bechuanaland—The total assistance from the Colonial Development Fund for schemes in the Bechuanaland Protectorate so far approved amounts to £92,228 This includes provision for three hospitals A scheme for training native nurses in the three High Commission Territories has also been initiated, and the general administrative expenditure on medical services in the Protectorate has been substantially increased in the last few years

Scottish Public Health Laws—Mr ELLIOT, replying on February 16 to Mr Westwood, said that Scottish local authorities had expressed a desire for the consolidation of the law relating to public health He had sympathy with their views, and was keeping the matter before him in his consideration of the report of the Committee on Scottish Health Services

Keratitis from Mustard Gas—Mr RAMSBOTHAM, on February 16, informed Mr F Roberts that a few cases of keratitis, which could in certain instances be ascribed to the effects of mustard gas, had occurred in recent years Eight such cases were accepted for compensation by the Ministry last year This was a rather higher number than in the previous year

Maternal Mortality Report—The report on the special investigations recently made by officers of the Ministry of Health into maternal mortality in various parts of the country is now being printed for early presentation to the House of Commons



Infant Mortality in Scotland—Mr Elliot furnished Mr Rhys Davies on February 18 with tables showing the ten public health areas in Scotland (that is, counties and large burghs) with the highest infant mortality rates for the quinquennial period 1931–5 and the decennial period 1921–30, together with the corresponding rates for Scotland

Infant Mortality Rates

1931–35	Per thousand	1921–30	Per thousand
Scotland	81	Scotland	89
Glasgow Burgh	102	Dundee Burgh	113
Coatbridge Burgh	102	Glasgow Burgh	106
Greenock Burgh	98	Aberdeen Burgh	105
Dumfries Burgh	93	Coatbridge Burgh	105
Paisley Burgh	91	Greenock Burgh	105
Hamilton Burgh	87	Paisley Burgh	101
Aberdeen Burgh	86	Dumfries Burgh	100
Port Glasgow Burgh	86	Stirling Burgh	95
Airdrie Burgh	85	Kilmarnock Burgh	94
Clackmannan County	85	Port Glasgow Burgh	93

Mental Hospital Accommodation in Lancashire—Sir KINGSLEY WOOD gave an assurance on February 25 that the present inadequacy of accommodation for mental patients in Lancashire was not in any way due to delay on the part of the Board of Control in approving the Brockhall Institution extension or any other schemes submitted by the Lancashire Mental Hospitals Board

Employers Liability Bill—The Employers Liability Bill introduced by Mr Potts, was on February 26 rejected by the House of Lords on second reading by 143 to 115 During the discussion Mr F A MACQUISTEN said that as a lawyer

QUICK AS AN AMBULANCE—

In emergency cases the opportunity of an X ray examination is frequently the means of saving a patient's life In other serious cases, too, examinations carried out in the patient's own home are of the greatest possible value

Within forty minutes of the arrival of a PORTABLE X RAY Service Car, negatives are ready for inspection

More and more doctors are now using PORTABLE X RAY Cars for visiting private homes, nursing homes, and hospitals

A fully descriptive booklet will gladly be sent on request to the address below

he remembered the time when to secure compensation cases under the Employers Liability Act certain lawyers touts followed ambulances besieged hospitals and had understandings with some doctors inside who sent claimants to particular lawyers The Workmen's Compensation Act had almost killed litigation in such cases

Notes in Brief

In the middle of 1936 the number of persons between the ages of 60 and 65 who were insured under the National Health Insurance and Contributory Pensions Acts was estimated to be 850 000

The Minister of Health is considering in consultation with the President of the Board of Trade what action can be taken to prevent the sale of geysers which are not properly ventilated or are likely to get out of order

The overcrowding survey showed 21 794 overcrowded dwellings in Wales of which 16 706 were in the Administrative Counties

Medical News

The annual dinner of past and present students of the Royal London Ophthalmic Hospital will be held at Langham Hotel, Portland Place W, on Thursday, March 11 at 7 30 p m with Mr T Harrison Butler in the chair Secretaries Mr Charles Goulden, 89, Harley Street, W 1, and Mr P G Doyne, 60, Queen Anne Street, W 1

Under the auspices of the British Institute of Philosophy an address will be given by Dr Joseph Needham entitled Should our Rulers be Biologists?' on Tuesday March 16, at 8 15 p m; at University College Gower Street, W C The chairman will be Professor Lancelot Hogben Cards of admission may be obtained from the director of studies at University Hall, 14, Gordon Square, W C 1

The annual meeting of the Mental After Care Association will be held at Girdlers' Hall 39, Basinghall Street E C, on Wednesday, March 10, at 3 15 p m The speakers will include the Bishop of London, Dr G A Lilly, Dr Isobel Wilson, and Dr Reginald Worth

A meeting of the Association of Industrial Medical Officers will be held at the London School of Hygiene and Tropical Medicine, Keppel Street W C, on Friday March 12 when there will be a business meeting at 4 45 p m and at 6 p m Mr Eric Farmer will speak on 'Accident Proneness Suggested Factory Investigations and Dr F H C Beards on "Organized Treatment and Rehabilitation of the Injured Workman' On Saturday, March 13, at 10 a m a visit will be paid to Carreras Ltd, Hampstead Road, N W and a tour of the clinic and works will be conducted by Dr T O Garland

A meeting of the London Jewish Hospital Medical Society will be held at the London Jewish Hospital, Stepney Green E, on Thursday, March 11 at 3 45 p m, when short papers will be read by Miss Muriel E Landau, F R C S on Menstruation, and by Dr S Levy Simpson on 'The Menopause' Mr A A Davis will also read a paper and Dr A Loeser will show a film on "The Hormonal Origin of Menstruation'

Dr E J Bigwood (Solvay Institute of Physiology, Brussels) and Dr Hazel Stiebeling (senior food economist, Bureau of Home Economics Washington) will speak on nutritional work in connexion with the League of Nations on Wednesday, March 10, at 5 p m, in the theatre of the Lister Institute of Preventive Medicine Chelsea Bridge Road S W 1 (nearest station, Sloane Square) All interested are invited to attend

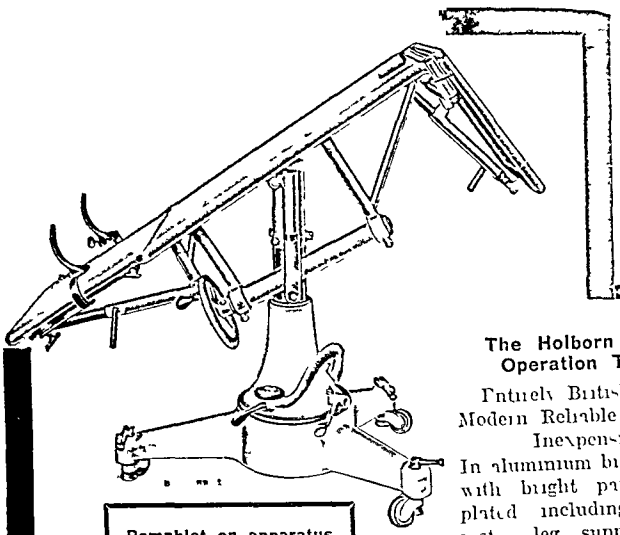
At a meeting of the Metropolitan Counties Branch of the British Medical Association to be held in B M A House, Tavistock Square on Tuesday March 9 Dr Cyril Norwood *president of St John's College* Oxford will give an address entitled The Doctor—as Seen by his Patient Reception and refreshments at 5 p m address at 5 30 p m

Dr C S Myers F R S, will deliver a lecture on Industrial Psychology and the Modern World at the Royal Society of Arts John Street Adelphi, W C on Wednesday March 10 at 8 15 p m Applications for tickets should be addressed to the secretary of the society

A meeting of the Royal Sanitary Institute will be held in the Guildhall Exeter on Friday March 12 at 4 45 p m when there will be discussions on Parts II and III of the Public Health Act, 1936 and on Physical and Recreational Training of the Adolescent'

The tenth annual congress of the German Association for the Study of the Circulation will be held at Bad Nauheim on March 13 and 14, the general topic for discussion being the part played by the internal secretions in circulatory disorders Professor Edward Stadler of Plauen will preside, and the first address will be given by Sir H H Dale on vasodepressor substances He will be followed by Dr H Rein of Gottingen who will discuss adrenaline and allied secretions Other subjects to be considered include the action of the hypophysis, hormones with reference to gynaecology, and thyroid disorders Excursions and social functions will be arranged A detailed programme of this congress may be obtained from the offices of the Deutsche Gesellschaft fur Kreislaufforschung, Residenzstrasse 32, Dresden Blasewitz

As already announced, the British Health Resorts Association has accepted an invitation from the Bournemouth Corporation to hold a conference at Bournemouth on Saturday, March 13 The programme consists of two sessions In the morning a discussion on Wintering in England' will be opened by Lord Horder followed by *Sir James Marchant and Dr K R Collis Hallowes* In the afternoon Professor Kestner of the Rowett Institute Aberdeen will open a discussion on the Curative Action of Sea Climate, in which Sir Walter Langdon Brown will take part



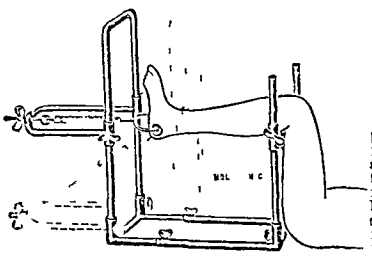
It was announced at the annual meeting of the governors of Cardiff Royal Infirmary held on February 25, that the Duke of Kent had consented to become president of the Infirmary The Duke of Windsor held that office for some years when Prince of Wales

A livery dinner, attended by the Lord Mayor and Sheriffs of London was given by the Society of Apothecaries in the Hall of the Company at Blackfriars on February 23 The Master, Dr A P Gibbons proposed from the chair the Civic Toast to which the Lord Mayor responded The Junior Warden, Dr R H Hayes submitted the health of the guests and this was acknowledged by Sir Cuthbert Wallace President of the Royal College of Surgeons, and Mr G N B Sebastian Master of the Skinners Company

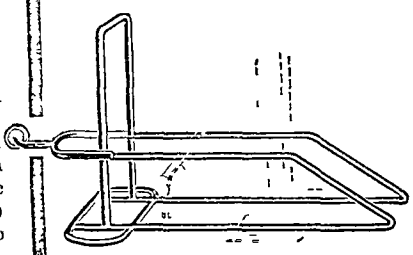
The first meeting of the National Advisory Council appointed by the Government to direct and co ordinate its scheme for encouraging physical training and recreation among all sections of the community, took place at the Board of Education on March 3 The council was occupied for some time with a preliminary survey of the ground covered by the scheme as well as in considering certain questions of immediate practical import It will probably do much of its work through subcommittees and maintain close collaboration with the Grants Committee, which entered upon its duties on March 1 Both bodies have their permanent headquarters at Queen Anne's Chambers, Tothill Street S W 1

During the week ended February 27 the number of deaths ascribed to influenza in the 122 great towns (including London) of England and Wales was 242 compared with 423 in the preceding week In London the number of deaths from influenza was twenty three against thirty three in the preceding week The notifications of pneumonia in London were 101 against eighty seven

The number of deaths from influenza in the larger towns in Germany in the fifty first week of 1936 was 595 as compared with fifty deaths in the corresponding week of 1935



The Holborn No 4 Operation Table



Entirely British Made
Modern Reliable Foolproof
Inexpensive

In aluminium bronze finish with bright parts nickel plated including shoulder rests leg supports with strap and polished zinc douching tray **£46 10 0**
Kidney Bridge built into top of table **£5** extra

Pamphlet on apparatus for the reduction of fractures and dislocations as used by DR LORENZ BOHLER post free on application

K60 — Bohler's Frame for the application of plaster bandage in fracture of the lower leg bone adjustable according to length of the limb with rest traction and special knee support designed to avoid flexor tendon on the inner aid of the knee tubular steel aluminium finish each **£3 3 0**
Ditto dull plated finish each **£3 15 3**

K64 — Braun's Splint for the lower leg adult or child size
1 Pulley **18/9** 3 Pulleys **22/6** 4 pulleys **27/6**

K65 — Support adjustable in height which may be placed over the Braun's Splint for flexing the knee indicated by dotted outline metal aluminium finish each **12/9**
Dull plated **18/6** Ditto wooden **19/6**

JOHN BELL & CROYDEN

Patent Triple-Drainage

SUPRAPUBIC APPARATUS

The appliance consists of a kidney shaped celluloid cup containing three outlets so arranged that no matter in what position the patient may be reposing complete drainage may be effected Provision is made not only for drainage by catheter but also for the removal of any urine which may pass between the catheter and the abdominal wall

All three outlets are connected with a rubber bag fitted with a non return valve which obviates any back flow A special duck fitting retains the catheter in its desired position and this should be placed between the abdomen and celluloid cup

The advantages are that the urine is immediately passed into the rubber bag all the parts can be removed and sterilized An easily detached adjustable belt is fitted

The pressure on the cup can be increased at the upper and lower border by increasing the tension on the upper or lower short webbing straps

Clean frequently and avoid any grease getting in contact with the rubber the celluloid must not be boiled

When ordering please state size of catheter and circumference of hips

QUERIES AND ANSWERS

Disfiguring Vaccination Marks

"R I E" (London) writes I have been asked by a young undergraduate to remove what he considers the disfiguring marks of three vaccinations performed in his childhood Could any fellow practitioner tell me of a safe method of doing this?

Income Tax

Mortgage with Building Society

"J" entered into a contract last July with a building society to purchase his house under a "mortgage insurance scheme and has made some quarterly payments Should the income tax on the property be paid by J ' or by the society?

*** "J" is liable for the tax, but as he does not deduct income tax from the interest element in the payments to the society he is entitled to some relief in accordance with the arrangement made between the building societies and the Inland Revenue The allowance is usually in respect of the interest paid in the previous financial year so that "J" will not receive the relief for 1936-7 This does not apply to any payments in respect of life insurance that may be made under the contract, and relief in respect of such payments should be claimed for 1936 7 onwards

LETTERS, NOTES, ETC.

Treatment of Gonorrhoea

Dr G ARBOUR STEPHENS (Swansea) writes You are to be praised for the emphasis you lay upon the need for properly accepted standards of therapeutic activity in connexion with the use of sera for the treatment of gonorrhoea as described by Dr Anwyl-Davies I feel that Dr Anwyl-Davies might have dealt with the subject of the natural immunity which exists towards this disease, as well as with the variation in the rate of response by patients to even the simplest forms of treatment Dr Anwyl-Davies has been tempted to investigate the value of a complicated and dangerous serum, but I expect he has scorned the simple treatment which you have allowed me to put forward in the *British Medical Journal*—namely, that by means of the subcutaneous injection of distilled water This treatment has been tried and its value confirmed by workers on the Continent and the results I have had even in the most severe arthritic cases justify a trial at the St Thomas's clinic by Dr Anwyl-Davies, if only by way of control Everyone knows that the treatment of gonorrhoea in a tuberculous subject is a much more difficult and serious matter than in one who is apparently strong As I have shown the severe cases of acute or chronic gonorrhoeal rheumatism occur in the "acid type" of person, and no treatment can be satisfactory until this point is realized A person in whom the *p*H of the blood or whose "acid base balance leans too much to the acid side responds badly to all methods of treatment My experience leads me to think that the arthritis is due to an added infection in gonorrhoea brought about by the introduction of a protozoon such as I think exists in acute rheumatism, and of which the Aschoff body is the encysted form The rationale of treatment by subcutaneous injection of distilled water is that the introduction of a liquid with a high surface tension acts upon the local cells free and fixed, causing them to discharge an antibody which reacts on the blood and renders it immune to the parasites Such an antibody must be naturally of a specific nature the high surface tension of the distilled water merely helping the mobilization of the antibodies

Prostatectomy by the Two-stage Method

Mr MORTON WHITBY (London, W 1) writes Mr W K Irwin (*Journal* February 6, p 261) is to be congratulated upon his excellent results, which show a lower mortality than any previous record Regarding the open method, there is no doubt that Mr Irwin's two stage procedure is the best but I cannot agree in spite of his success, that it should always be practised. Obviously the closed method is the operation of choice whenever it can be carried out with safety However, I agree that time will show whether Harris's operation of plastic surgery to the trigone is warranted I am convinced from the results of my own operation of complete closure (described in the *Lancet* 1934) that plastic surgery of the trigone is unnecessary as I believe apart from prolonging the operation post operative pyelitis and latent stricture are liable to occur Surely it is unsound surgical practice to perform plastic reconstruction, which is the basis of Harris's operation in a septic area I have found that even continuous pre operative bladder irrigation by means of my two way catheter will not completely eliminate prostatic sepsis although it is the only means by which it can be reduced to a minimum Mr Irwin's clamp incisor for removing any redundant prostatic bar is a useful instrument, and produces highly satisfactory results In conclusion I would say that the two stage open method or the closed method should be advocated according to the condition of the patient, but with the evolution of prostatic surgery our aim should be to make the closed operation safe for all, since convalescence is shorter, and with careful pre operative and post operative treatment complications immediate and remote should gradually become unknown with the individual operator's improved technique

External Use of Iodine

Dr CHARLES BARBER (London, W 1) writes I should like to support the conclusions of Dr Macaulay on the use of iodine in the *Journal* of February 13 (p 374) Iodine is certainly devitalizing, and responsible for much dermatitis and often ulceration of the skin and stitch abscesses I gave it up years ago unless there was nothing else available, and especially avoided it as a final application to clean operation wounds using instead a light brushing over of the wound and surrounding skin with the old fashioned friar's balsam (tinct benz co) This has a strong antiseptic as well as a soothing and healing effect on skin and wound and, moreover, anchors the first layer of gauze, and so prevents movement of the dressing and possible entrance of infection On removing the dressing the skin is always found clean and smooth and not irritated, and the stitch holes free from suppuration The benzoin stain is easily removed by a spirit swab I do not know whether tinct benz co has ever been supplied in a first aid outfit, but if not I think it would be immeasurably superior to iodine

A Cheap Transilluminoscope

Mr E S GOPALAN (honorary assistant surgeon to the G Hospital Madras) in the course of a letter in which he refers to Mr Hamilton Bailey's description of a transilluminoscope (*Journal* April 18, 1936 p 795), suggests the use of a cheap and effective device This consists of a one-foot length of ordinary hosepipe with an inner lining of black rubber and an internal diameter of about one and a quarter inches This can be used quite effectively in broad daylight as a form of transilluminoscope—costing only about a shilling

4 reasons why every modern G P should be equipped with Gowlland electric diagnostic instruments

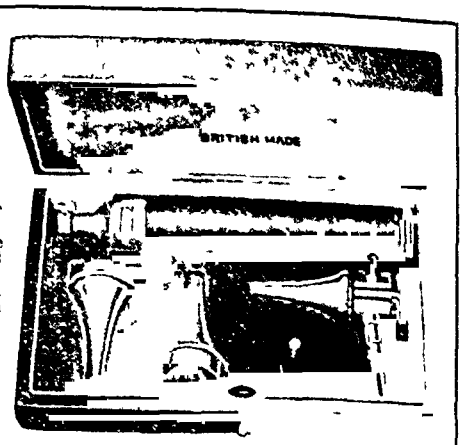
THE MOST MODERN IN DESIGN

Meeting with the universal approval of the Medical profession, the "Gowlland" embodies the latest and most up-to date improvements

PERFECT WORKMANSHIP

The instruments have been designed by craftsmen guided by a knowledge of the requirements of the medical profession, and built on a sound engineering basis, of accurate fits, and solid construction

UNTARNISHABLE FINISH



The instruments are heavily chrome plated by the latest plant specially installed for finishing medical instruments

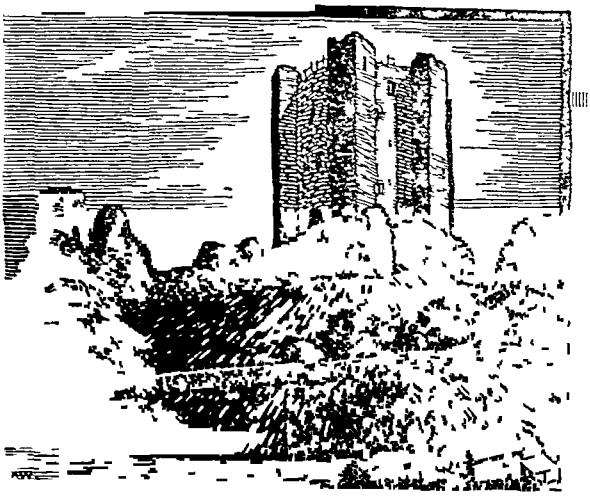
Medicine

171 Pulmonary Embolism

G HULTQUIST (*Svenska LakSallsk Handl*, 1936, Bd 62, Heft 4, p 265) publishes in German an account of a statistical investigation conducted at the St Erik Hospital in Stockholm Between January 1 1925 and March 31 1934, the pathological department dealt with 814 cases of aseptic pulmonary embolism In 153 the embolism was considered as the immediate cause of death In seventy nine the embolism was associated with other diseases, such as heart disease and pneumonia In the remaining 582 cases the embolism with or without infarcts was less serious Excluded from this material were the cases of small pulmonary infarcts whose origin could not be traced to embolism as well as the cases of autochthonous thrombosis in the pulmonary artery This statistical study showed that women are more subject to aseptic pulmonary embolism, whether it be slight or fatal, than men, this sex difference being greatest in fatal embolisms The liability to pulmonary embolism increases uniformly with age in both sexes and the behaviour of this ailment is largely the same in surgical as in medical wards In both the fat are more likely to die of pulmonary embolism than are the thin although in medical wards the develop ment of small pulmonary emboli does not appear to be favoured by an excess of fat Diseases of the circulatory system are more frequent among the subjects of pul monary embolism than in post mortem material taken as a whole The contrary could be said of malignant tumours and pulmonary tuberculosis, perhaps because of the emaciation they entail The author supplements these general conclusions by noting that pulmonary embolism was almost twice as frequent in the medical as in the surgical wards of his hospital—a fact he associates with the comparatively high age of the patients and the number of cases of disease of the circulatory system in the former But the frequency of fatal pulmonary embolism was practically equal in the medical and surgical wards No evidence could be found for the incrimination of intra venous injections as a cause of thrombosis and pulmonary embolism in the overwhelming majority of the cases studied

172 Sero fibrinous Meningitis

A SAVULESCO (*Rev Sensibil* December, 1936, p 75) discussing the clinical relations of tuberculous, serous and sero fibrinous meningitis from the pathogenic and therapeutic standpoints concludes that the last two con ditions represent a syndrome of exudative meningeal sensitization of progressing severity, which may respond in the earlier stages to desensitizing treatment When the serous effusion becomes fibrinous the risk to the patient is intensified, and localizing signs of the deposit of fibrin plaques on the brain can be detected He records two cases treated successfully by the intravenous injection of sodium iodide, either mixed with the patient s own blood or associated with intramuscular auto haemotherapy in both cases there was intense headache with localizing symptoms, and death was narrowly averted In one patient during treat ment there was marked diuresis and in the other profuse perspiration, both indicating the relief of the waterlogged tissue cells The author regards his method of treatment as twofold general and metameric desensitization He has previously demonstrated the value of sodium iodide as a general desensitizing agent In the first case this salt was associated with septicemine (diformine iodo benzomethylate) and casein was also employed, relief of the symptoms ensuing rapidly when they were injected, and further meningeal damage being averted The casein was injected into the contracted muscles during the cephal algic paroxysms, its action persisted for a few hours, but this treatment had sometimes to be repeated in the more severe cases Savulesco remarks that simple serous meningitis can be quickly cured by the appropriate desensitizing measures When the fluid becomes fibrinous the deposits are less well tolerated than in the comparable condition of pleurisy because of the damage done to the nerve centres by them, and hence desensitizing treatment must be prompt, especially when the pathognomonic symptoms of tuberculous meningitis are present The sodium iodide must be chemically pure and relatively large doses should be injected intravenously



173 Heart Sounds

The importance usually assigned to the heart valves in the production of heart sounds is denied by A M KASSATKIM (*Arch Mal Cœur* December, 1936, p 735) who believes that such thin structures, of poor flexibility bathed in a viscous liquid which cannot act as a resonator could not be the source of these sounds He also objects to the first sound being described as having a muscular element, holding that such a term can be properly applied only to the sound produced by a muscle undergoing tetanic contraction, which the myocardium does not It is held that the explanation of the sounds is more reason ably to be sought in the elastic properties of the walls of the heart and great vessels and that the mechanism involved is similar in principle to that of the hydraulic ram the hydrodynamics of which are described Briefly the heart sounds on this view are held to be caused by the vibration of the elastic heart and vessel walls set up when a current of blood is suddenly interrupted by the closure of a valve Thus the first sound results from vibration set up in the ventricles by waves produced by the closure of the auriculo ventricular valves and the second sound from vibrations in the walls of the aorta and pulmonary artery, secondary to fluid waves which arise from the closing of the semilunar valves

Surgery

174 Therapeutic Local Anaesthesia

R LERICHE (*Brit med* December 27, 1936 p 291) is of the opinion that infiltration of the peri articular tissues and of the sympathetic chain is of great value in cases of injury to joints and of lesions connected with the sym pathetic nervous system For the last thirty years the injection of novocain has been used for many lesions with varying results Leriche has carried out experiments in the use of novocain on the regional ganglia which are the centres for vasoconstrictor action Injection of the stellate ganglion produced more or less complete inter ruption of the vasoconstrictor action over a large area including half the face the neck and upper part of the thorax part of the brain the salivary glands the heart lungs and upper limb As a result cessation of pain was noticed without loss of sensibility When the upper ganglia of the lumbar chain were injected a vasodilator action was seen in part of the abdomen and in the lower limb and pain in these regions disappeared It has been found possible to relieve pain on the right side by infiltrating the left stellate or pain in the right lower limb by operating on the left lumbar sympathetic No reason for these results can be given but it is considered that the discovery may have therapeutic possibilities This method of treatment has been tried successfully in cases of ampu tation fracture sprain and traumatic arthritis Infiltra tion of the sympathetic ganglia has been tried in cases of angina chronic myocarditis embolism arteritis, and bilateral puerperal phlebitis

175 Surgical Treatment of Hypertension

G J HEUER (*Bull Acad Med Toronto*, December, 1936, p 57) discusses the surgical aspects of essential hypertension and points out that medical treatment has no lasting effect in cases of abnormally high blood pressure To be successful surgical procedure must aim at the relaxation of the spastic arterioles of the splanchnic area and the denervation of the adrenal glands This might be effected by splanchnicotomy or section of the anterior nerve roots of the spinal cord Experimental work was carried out on the lines of the latter method of treatment, and it was found that the splanchnic vessels constitute an important but not the only flexible reservoir governing the level of arterial pressure Elevation of arterial pressure in patients suffering from essential hypertension is believed to be due in part to constriction or loss of elasticity of these vessels In the selection of patients for section of the anterior nerve roots the form of the disease varied from benign essential hypertension of short duration to the highly malignant hypertension Prolonged observation of patients before and after operation was considered to be of great importance, and included the study of the subjective manifestations of the disease, the psychic abnormalities, and evidence of instability of the nervous system The operation of rhizotomy consists of the bilateral division of the anterior roots of the sixth dorsal to the second lumbar spinal nerves It was found most satisfactory to do the operation in two stages, the first terminating with the completion of laminectomy and the exposure of the dura, the second consisting in the opening of the dura and division of the anterior nerve roots An interval of several days was allowed to elapse between the two stages The serious danger in the operation is the possibility of a lesion of the cord giving rise to paralysis of the lower extremities, bladder, and rectum The results obtained in twenty-two cases treated by this method are very fully analysed It was found that good results were seen in 80 per cent of mild and moderately severe cases, while in severe advanced cases the results were much less satisfactory

176 White Blood Cells in Acute Appendicitis

K H LANGE (*Med Welt*, December 12, 1936, p 1801) finds that examination of the leucocytes may assist in the decision whether to operate in acute appendicitis During the first twenty-four hours a lymphopenia is always noted, combined with left displacement and possibly with increase of total white cells After twenty-four hours the lymphopenia may be found to be replaced by lymphocytosis, which is to be regarded as evidence of natural resistance The practical indications for operation are given in the first twenty four hours by lymphopenia and left displacement, after then by lymphopenia In the second case a lymphocytosis may be a factor in justifying expectant measures Lymphocytosis in the initial hours of an attack of abdominal pain is a sign calling for reluctance to operate, it is found in inflammation or tuberculosis of the mesenteric glands and at the time of follicular rupture in females

177 Hydatid Cysts of the Lungs

S KAMBOSSEFF (*Zbl Chir*, January 9, 1937, p 81) describes in detail the surgical treatment of centrally situated hydatid cyst of the lungs The pulmonary localization of hydatid cyst varies between 7 and 23 per cent Its site of predilection is the right lower lobe The operative treatment is successful in about 90 per cent of cases The author resects 6 cm of one rib only under local anaesthesia and then makes a tunnel through the lung tissue to the cyst by means of a thermocautery The collapsed cyst soon obliterates and the thoracic wound is closed by means of catgut sutures and plugging In the cases of deep seated cysts and in the absence of pleural adhesions the operation is performed in two or three stages In the first stage the parietal and visceral pleura are joined by catgut sutures and the pleural adhesion is encouraged by an application of tincture of iodine, which acts as an irritant The second stage consists in the tunnelling of the pulmonary tissue, which should be directed radially toward the hilum in order to avoid severe haemorrhage and damage to the bronchial tree In cases of severe haemorrhage it may be necessary to plug the wound and postpone the termination of the operation for forty eight hours The author cites several cases successfully operated on in this way

Therapeutics

178 Acute Rheumatic Fever

B HAUER (*Med Welt*, January 16, 1937, p 85) recommends intravenous injections of glucose melubrin novalgin in acute rheumatic fever He admits the favourable action of salicylates in a large proportion of cases, but salicylates sometimes fail They also depress the appetite and may cause giddiness, tinnitus, etc Incidentally the author records instantaneous relief from lumbago with a single intravenous injection of 2 to 3 c cm of novalgin In acute rheumatic fever in adults he gives a mixed intravenous injection of 4 c cm of melubrin plus 2 to 3 c cm of novalgin plus glucose Even the severest cases lose pain for about ten hours The injections are given daily As the condition of the patient improves the dose is decreased The melubrin and the novalgin are well tolerated, even by patients whose heart has been affected

179 Mountain Air

F HAMBURGER (*Wien klin Woch*, January 8, 1937, p 17) states that, although no specific reasons can be given, an altitude of 1,800 to 3,000 feet has an undoubted beneficial effect in the treatment of many diseases of children Whether this is due to fresh air, ultra-violet radiation, or the difference in diurnal and nocturnal temperature is unknown He believes that the psychic effect is important Joy increases muscle tone and appetite Thus sunshine, fresh air, and joy, which are lacking in the child's ordinary environment, are factors contributing to his health in a higher altitude Hamburger is convinced that most of the catarrhal diseases are not due to "catching cold," but to infection when resistance is lowered through the unnatural "room-life" of modern civilization He advocates mountain air for nearly all forms of tuberculosis, with the exception of the acute miliary type Children who have apparently recovered from tuberculosis should be sent to a higher altitude for a few weeks for two successive winters Mountain air is beneficial in the treatment of all catarrhal conditions of the upper air passages, of children with acute or chronic swollen glands of the neck, and of those with anaemia and psychic disorders It is contraindicated in rheumatic conditions The author pleads, in view of the known importance of natural resistance to infection, for longer winter holidays, and points out that the disease incidence in two schools in Vienna which remove with their teachers to a higher altitude for three to four weeks every winter is very small He is convinced that if their example were followed much of the illness of children in winter would be prevented

180 Amidopyrine in Rheumatic Polyarthritis

K E ROTSCHUH and M BENARD (*Klin Wschr*, December 12, 1936, p 1838) have investigated on a series of 1,000 patients the value of pyramidon combined with physiotherapy in rheumatic conditions Five hundred patients received physiotherapy only, while the other 500 received physiotherapy plus 2 to 3 grammes of pyramidon a day during the course of treatment (six weeks) They were unable to detect any advantage from the addition of pyramidon to the physiotherapeutic procedures

MODERN DISCOVERIES IN MEDICAL PSYCHOLOGY

By Clifford Allen, M D , M R C P , D P M

This book describes simply the advance in Medical Psychology from Mesmer to Freud It discusses the theories of Janet Prince Kretschmer, Freud Jung Adler and Pavlov and criticises their treatments It gives the general physician and the specialist a clear outline of modern psychotherapy

MACMILLAN 8s 6d net

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name, by such means the Bank succeeds in combining domestic tradition with business efficiency A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch or at the branch situated in B M A House, Tavistock Square, W C 1

County Caravan
Courtsip Farm
Sundale Kent

Dear John February 28th 193

Many thanks for your letter Yes it is a change living in Town after so many years in the country but I have bought a County Caravan and we run out to it almost every week end At present we are in it in a field close to my Golf Club, later we shall move it nearer the sea When we do our usual trip to Scotland we shall take it, and only use Hotels for occasional meals On our way North we shall call on you —one morning you will find us camping on your drive

I bought a County Caravan because I hired one last year and liked it It is roomy well arranged and comfortable Well built with double walls it is so dry I can make a few minutes after we light up even in this weather There are Dunlop beds very good Another joy is its Sun Flap Mary loves it As you know she hardly goes near the kitchen at home, but with a little advice from me she produces wonderful breakfast and suppers —I can go in out for other meals We have wireless but no telephone thank goodness Yours till you see us on your drive

David

Ophthalmology

181 Industrial Eye Injuries

J MINTON (*Brit J Ophthal* December, 1936, p 673) states that at the Royal Eye Hospital about 65 per cent of the out patients suffer from industrial eye injuries Of these 50 per cent are due to the emery wheel, and the majority of intra ocular foreign bodies to hammering and chipping In the case of corneal foreign bodies there is usually a latent period of six to twelve hours (sometimes several days) before symptoms appear the degree of irritation being dependent on the amount of rust formation A corneal foreign body should be removed with a discission needle and never with a spud or blunt instrument A rust ring should always be removed and a mydriatic given in every case If an intra ocular foreign body is suspected a skiagram is essential Lime burns are treated with neutral ammonium tartrate (15 per cent glucose is used in the hospitals) Nearly all cases of welding conjunctivitis (photophthalmia) were due to lack of use, or misuse of the protection provided Symptoms appear in six to eight hours, and are best allayed by paroleine drops and a pad and bandage All injured eyes are seen again in twenty-four hours Abrasions from wood paper concrete or cement and lime and chemical burns cause most anxiety So long as there is any corneal staining with fluorescein a mydriatic with a pad and bandage must be used About 1 per cent of all cases of injury required admission for complications The writer quotes from annual reports of the Chief Inspector of Factories, American insurance statistics the Departmental Committee on the Causes and Prevention of Blindness 1922 and the State Department of Labour and Industry of Pennsylvania He describes the Home Office Industrial Museum Westminster and the exhibition of preventive measures to be seen there The great difficulty is that many workmen refuse to avail themselves of certain forms of protection

182 Ocular Changes in Disseminated Sclerosis

D MARSHALL and R G LAIRD (*Amer J Ophthal* December, 1936 p 1085) review 100 consecutive unselected cases There were visual disturbances at some time in 50 per cent some of which preceded the diagnosis by several years The average age was 27 9 years and the average period between onset and the first medical examination four years The patients complained of reduced vision blurring diplopia, or field defects usually affecting only one eye seriously The blurred vision may last for days or weeks Nystagmus, including nystagmoid jerks occurred in 70 per cent An Argyll Robertson pupil was rare Evanescent ocular palsies were seen in 10 per cent optic atrophy in 20 per cent optic neuritis and retrobulbar neuritis only rarely 20 per cent showed field defects, which were variable and inconstant That hemianopia can occur is proved by a case which is fully described and illustrated by diagrams of the fields

183 Myopia in School Children

G NORDGREN (*Nord med Tidskr* December 19 1936 p 2069) finds that opinions are approximately equally divided between the two explanations (heredity and environment) of the genesis of myopia in school children The protagonist of the latter explanation was *Hermann* Cohn whose published researches date from 1867 whereas the chief exponent of the hereditary factor is Steiger whose work dates from 1913 The author has attempted to throw further light on this problem by a study of the incidence of myopia in Swedish school children since *1894 the* year in which systematic records of this condition were first made by the Swedish school authorities The numbers dealt with are in the author's opinion big enough to carry considerable weight in 1894 some 14 000 scholars were dealt with and in 1918 this number had risen to 27 000 Between 1894 and 1920 the percentage of school children suffering from myopia was reduced by about one third it was significant that the most important hygienic reforms in the schools were carried out about the end of the nineteenth century In 1895 in the youngest class 5 2 per cent of the children suffered from myopia The corresponding figure for 1918 was 3 7 per cent In both years there was a uniform rise in the frequency of myopia as the ages of the school children *rose and in the oldest class the* incidence of myopia was 24 6 per cent in 1895 and 19 1 per cent in 1918 Between 1920 and 1935 there was little change in the frequency and severity of myopia While no correlation could be established between constitution and physique on the one hand and myopia on the other some relation seemed to exist between it and the general sickness rate The author comes to the conclusion that there is a striking relation between general hygiene and general health on the one side and the frequency of myopia on the other and the alternative explanations he suggests of this relation are either (1) that a weakly constitution predisposes both to myopia and to various other diseases or (2) that extraneous factors are alike capable of provoking both myopia and various other diseases He believes that both factors are of importance however difficult it may be numerically to apportion the relative importance of each

184 Tests for Hyperphoria

F W MARLOW (*Arch Ophthal* Chicago December, 1936 p 982) points out that both Duane and Maddox emphasized the importance of the covering of an eye to determine hyperphoria and that the latter insisted that the eye should be covered long enough for the deviation to develop In many cases the test is incorrectly applied—the covering is not prolonged sufficiently and the results are disappointing The writer takes exception to the statement in Berens's recent book *The Eye and Its Diseases* that the test is sometimes of value and in other cases induces artificial conditions The short tests described in this book only discover the manifest error whereas prolonged occlusion gives the latent error Thus the short test discloses 20 per cent of hyperphoria in 700 cases whereas by the prolonged test 84 per cent was found in a similar number of observations Of fifty five cases of esophoria as detected by the short test the esophoria increased in 12 per cent decreased in 38 per cent changed to exophoria in 38 per cent and hyperphoria developed in 77 per cent after prolonged covering

185 Acetylcholine in Ocular Affections

VERRIEST (*Arch med belges* November 1936 p 245) reports eight cases of ocular affection of which six were markedly benefited by injections of acetylcholine The action of this drug is less intense but more prolonged than that of amyl nitrite Amaurosis from ischaemia of the retina due to embolism of the central artery quinine progressive atrophy and excessive systemic haemorrhage responds to this type of treatment *Full notes of the eight* cases are given in the paper

186 Eye Changes in Congenital Syphilis

D CATTANEO (*Athena* November 1936 p 465) after quoting authors who have found morbid ocular conditions in 39 48 per cent of cases of congenital syphilis states that in syphilitic foetuses of seven to nine months he has found spirochaetes although practically absent from the retina and fluid media specially common in the sclerotic iris and ciliary body Conjunctivitis in congenitally syphilitic children is not usually associated with the presence of spirochaetes but affections of the lachrymal passages are much more often syphilitic than is usually recognized Although histological evidence points to the almost invariable presence of spirochaetes in the cornea of syphilitic foetuses a coincident keratitis is very rare—the classic keratitis as part of Hutchinson's triad first appears in infancy or adolescence—though Cattaneo has found evidence of congenital lues in 106 of 111 cases

Syphilitic keratitis may be of anaphylactic rather than of inflammatory origin It was found to be accompanied or followed by iritis or uveitis in 90 per cent of cases Syphilitic iritis is occasionally present in luetic foetuses, of whom one third show choroiditis Ophthalmoscopic evidence of the latter is commonly found in late forms of congenital lues, but has been noted in 10 per cent of syphilitic sucklings, of whom some 75 per cent show a grey colour and a characteristic pigmented ring in the peripapillary zone Other features of choroido-retinitis are yellow, white, or pigmented choroido retinal scars Some two-fifths of those with interstitial keratitis show signs of choroido-retinitis Although it is certain that a large proportion of congenitally luetic subjects show a pallor of the optic disk, this is a sign of general anaemia and not of optic atrophy

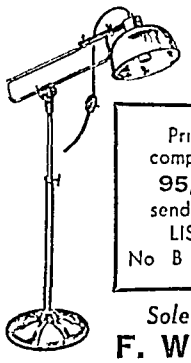
Obstetrics and Gynaecology

187 Brachial Endometriosis

E NAVRATIL and A KRAMER (*Klin Wschr* November 28, 1936, p 1765) recall that intraperitoneal endometriosis, most common near the regions developed from the Mullerian ducts is more rarely found in laparotomy scars the navel the groin the labia, and the vagina Recently in one case a typical nodule has been described in the thigh For many extraperitoneal endometrioses a genesis by implantation (according to Sampson's theory) or direct extension is impossible, and the explanation must be found either in a local development from mesenchymal elements or in a passage, as postulated in Halban's theory, of endometrioid tissue along lymphatic vessels R Meyer, although not conceding that lymphatic propagation is frequent, would use it to explain certain extraperitoneal endometrioses, and has written that Halban's theory would find strong support were a case of endometriosis in the upper half of the body to be reported Such a one is here described The patient, a woman aged 25, who two years previously had had abortion induced at the third month for pulmonary tuberculosis, had a tumour the size of a date in the extensor carpi radialis muscle at each menstruation it became painful and tender and increased to double the size Differential diagnosis from ganglion or tuberculous lymphatic gland was assisted by injections of corpus luteum hormone, which deferred by nine days both menstruation and the painful enlargement of the lump There were no clinical signs or symptoms of pelvic disease The excised tumour showed typical endometrioid glands in a chronically inflamed stroma free from non-striped muscle No evidence was found of a relation of the gland tissue to neighbouring blood or lymphatic vessels

188 Internal Haemorrhage from Chorion Epithelioma

According to O BURMESTER (*Zbl Gynak* December 19 1935, p 3021) chorion epithelioma is a rare cause of acute severe intra-abdominal bleeding He records the case of a woman who for six weeks after the removal of a hydatidiform mole during the fifth month of pregnancy had no morbid symptoms or signs except the presence of bilateral adnexal cystic swellings and the persistence, in constant intensity, of the Aschheim-Zondek reaction in the urine Sudden severe internal bleeding then necessitated laparotomy, which revealed haemorrhage from a small subserous nodule of chorion epithelioma Subsequent examination of the uterus, which was not enlarged showed a similar nodule placed opposite the first in the submucous position The patient is in good health twenty-one months after her operation Burmester remarks that if in spite of the absence of morbid signs curetting had been done—by reason of the persisting Aschheim-Zondek test—two or three weeks after delivery of the mole it is probable that the submucous neoplastic zone or part of it would have been removed, the condition diagnosed microscopically, and the patient operated on without having had to experience dangerous internal bleeding



Pathology

189 Placental Autolysis

H MAYEDA (*Acta Sch med Univ Kioto* vol 18, fasc IV, p 210) investigated the formation of lactic acid (dextrorotatory) during the autolysis of the human placenta when *d*-glucose was added Immediately after birth the placenta was freed of the membranes and umbilical cord, minced and well stirred, and divided into four to six portions of 50 grammes The first portion was subjected to *d* lactic acid at once, the rest after four days' digestion with 500 c cm chloroform water and *d*-glucose at 37° C All portions were sterile The first portion was boiled after the addition of 500 c cm of water and 1/2 c cm of concentrated sulphuric acid, the other portions after four days digestion The portions were stood in a water bath until they became a syrupy mass and then mixed with alcohol and allowed to stand for a day, 200 c cm of alcohol were then added to each portion and the extract cooked in a water-bath for thirty minutes, cooled and filtered This was done three times The alcohol was distilled off, the remainder strongly acidified with phosphoric acid and extracted for three days with ether The ether was distilled off, 50 c cm of water added, and the whole warmed in a water-bath with lead carbonate for half an hour, filtered, and the new extract washed with hot water The portions were then extracted with ether again for two days The *d*-lactic acid which remained behind was estimated by the polarimetric method Mayeda was able to show that the formation of *d* lactic acid was markedly increased in those portions of autolysed human placenta to which *d*-glucose had been added

190 Cerebro-spinal Fluid Sugar in Meningitis

N I NISSEN (*Ugeskr Laeg*, December 31, 1936, p 1709) has conducted in a Danish hospital investigations of the sugar content of the cerebro-spinal fluid to ascertain its value in the differential diagnosis of various forms of meningitis and certain other diseases, such as the non-paralytic forms of poliomyelitis The technique adopted was that of Hagedorn and Norman Jensen and it was found that the sugar content of the cerebro spinal fluid could be determined with just as great accuracy as that of the blood Altogether 529 patients were examined and 864 analyses undertaken All the afebrile patients without manifestations of disease of the central nervous system yielded figures between 45 and 65 mg of sugar per 100 c cm of cerebro-spinal fluid after the administration of large quantities of glucose by the mouth In practically all the cases of tuberculous meningitis the corresponding figure was below 40 mg per 100 c cm In most of these cases the figures lay below 30 mg per 100 c cm It will thus be seen that this test gives a valuable clue to the diagnosis of tuberculous meningitis Less instructive were the sugar findings in purulent meningitis in many cases of which normal figures were obtained, cases terminating fatally often showed normal or even high sugar concentration The changes in the concentration of sugar in the cerebro-spinal fluid were quite independent of the morphological and other changes in the cells of this fluid Nor could any relation be established between the sugar and protein contents of the cerebro spinal fluid On the other hand the behaviour of the sugar and the chloridine concentrations in the cerebro spinal fluid showed a well defined parallelism The author concludes that the threshold between benign and malignant meningitis can be put at 40 mg per 100 c cm, any figure below this being exceedingly rare in benign meningitis The determination of the sugar content of the cerebro spinal fluid has now been adopted in his hospital as a routine measure to which he attaches greater diagnostic value than to cytological examinations and protein analyses

"DUO-RAY" INFRA-RED RAY APPARATUS

To those in General Practice this apparatus is of paramount importance for the treatment of Rheumatism, Lumbago, Neuritis, Sciatica, Metatarsalgia and many other conditions

The apparatus has been supplied by us to

LONDON HOSPITAL
KING'S COLLEGE HOSPITAL
GUY'S HOSPITAL

Reports of Societies

FREQUENCY OF MICTURITION IN THE ADULT

At a meeting of the Hunterian Society held on December 14th, 1936, with MR H L ATTWATER in the chair, the subject for discussion was 'Frequency of Micturition in the Adult'

MR ALEX E ROCHE said that the function of the bladder was to convert a continuous secretion into a discontinuous excretion With complete failure of this pump-like mechanism the urine escaped at once in a constant dribble, as in distension overflow A lesser but commoner degree of bladder failure caused the urine to be expelled not constantly but much more frequently than usual This might interfere with intellectual and other activities and even undermine health by impairing sleep Although male and female bladders were the same in size the female had the greater tolerance, perhaps an adaptation to meet the pressure of pregnancy In assessing the value of the symptom of frequency it was necessary to ask about the patient's usual habit for example, in a male of 50 or over two or three nocturnal micturitions were of little importance if nocturnal micturition was a lifelong habit but if of recent origin they were a symptom of prostate trouble Excessive frequency was due mainly to polyuria or to decreased bladder capacity or both Polyuria might be due either to diuretics including water or to inability of the kidneys to secrete urine of normal concentration the urine being thus of constantly low specific gravity Decreased bladder capacity might be organic or functional The former included external pressure by pelvic swellings such as ovarian cyst loss of distensibility due to muscular hypertrophy fibrotic contraction or infiltration of new growths, and partial occupation of the bladder by stones, growths ureterocele or a constant pool of residual urine Functional decrease of bladder capacity resulted from something ingested or contained in the urine from inflammation of the bladder itself or of neighbouring glands, or from reflex and other nervous influences It was not sufficiently realized that increased frequency might be renal in origin One authority (Kidd) had said that increased frequency was a sign *per excellence* of a diseased kidney rather than of a diseased bladder Insidious and progressive increased frequency was usually the first symptom of renal tuberculosis In bladder growths the first symptom was usually painless haematuria, but in the cystitic type of carcinoma there was usually frequency and pain In papillomas of the bladder the urine was usually clear and frequency normal After touching on the various and careful investigations necessary, MR ROCHE ended with a word or two on the subject of treatment which, he said must be governed by the cause He mentioned the value of instillations and washes with weak silver nitrate, and among drugs tincture of belladonna and sandalwood oil

Neurological Aspects

DR D E DENNY-BROWN said that to the neurologist cases of frequency arising from functional causes were much more common than those arising from organic It was very common in neurosis to find the patients complaining of lack of power of concentration These were the people in whom disturbance or frequency of micturition was found They were people in whom various processes ordinarily subconscious emerged too soon into consciousness. These were cases of a normal bladder which was giving rise to an abnormal sensation—the people were conscious of a desire for micturition and suffered from frequency Many people had frequency all their lives Some had such frequency that any sudden effort was liable to bring about some micturition Some had nocturnal enuresis which was constant, invariable and lifelong These people on examination were found to have an abnormally reactive bladder, usually a small bladder, though he did not think that was important, and they were quite unable to inhibit or suppress the contractions of the bladder at a volume of some 300 or 400 c.cm., or about half the volume which became urgent in the normal person He did not think the capacity of the bladder mattered very greatly There was a great variation in capacity but it was secondary to a variation in degree of ability to control micturition With regard to nervous disturbances of micturition arising from organic causes a common cause was chronic syphilitic meningitis All these were disturbances of frequency of efficient micturition, but there was also frequency of inefficient micturition Such a patient always complained of difficulty in beginning micturition, though he would also say that he felt impelled more often than usual to attempt to pass water These were states of partial retention and resulted from impairment of the connexions between the spinal cord and the vesical plexus

DR J C AINSWORTH DAVIS agreed with MR ROCHE that it was unpardonable to prescribe until a complete urological examination had been carried out Often the frequency was merely a symptom of a serious underlying cause which might be curable in its early stages A condition which caused frequency in women was chronic cervicitis a condition not taken seriously enough by gynaecologists. There was no doubt that if the chronic cervicitis were efficiently treated the frequency would clear up Ordinary douching and local applications were helpful up to a point, but a more thorough treatment by means of diathermy using the coagulating current was indicated

In the course of some further discussion, MR A E PORRITT described a physiological experiment undertaken under standardized conditions the result of which appeared to suggest that the build of the person had some definite relation to the frequency of micturition In a group of twelve men who figured in this experiment those who had the most urgent desire to micturate after a considerable period of retention were the small people and in these also the volume of urine was easily the greatest The deduction was drawn that body surface area had some relation to the rate of production of urine

INDUSTRIAL DISEASE

At a meeting of the Manchester Medical Society on December 2nd, 1936 DR R E LANE opened a discussion on industrial diseases Defining an occupational disease as one arising from and peculiar to a given industry, he gave a practical classification of these conditions

Dr Lane emphasized the importance of the respiratory tract as a portal of entry for industrial poisons He described the difference between the toxicity of a substance *per se* and the extent to which it constituted a health hazard in industry The former was largely dependent on the chemical nature of the compound whereas the danger to health in industry was to a great degree determined by the physical properties of the compounds handled The ease of absorption was a vital point in most industrial poisonings In the motor-body building industry for example lead poisoning had followed the inhalation of fine particles of metallic lead The importance of the physical state of the poisonous substance was illustrated by metal fume fever in which the attack was only brought on by the inhalation of metal fume in a very fine state of subdivision and dispersion If the same fume were allowed to stand for a short time before inhalation fever no longer occurred because a clumping of the very fine particles had taken place although of course the chemical nature of the fume had not altered Finally, Dr Lane stressed the importance of collaboration between medical and other technical experts and suggested that it was essential for the medical profession to be ready with accurate knowledge when consulted by the employer who must be held responsible for the health of his work people

Need for Research

Dr M W GOLDBLATT referred to the general ignorance of the effects of industrial products on the worker Attention was drawn to the dangers often only after calamities had occurred The necessity of systematic research in industrial medicine could not be too strongly emphasized The problem of the worker with some obscure and unsuspected idiosyncrasy might appear acutely at any time, even when the main facts about a given product might have led to the belief that no harmful effects were to be expected Criteria for the detection of susceptible subjects, particularly in regard to skin hazards, should be worked out, and such workers allocated to employment remote from exposure to the, for them, hazardous products It was not sufficient to conclude that a man was suffering from an industrial disease because he presented a symptom of a condition which might arise from his work It was similarly unwise for the dermatologist to conclude that a skin irritation was due to a dyed garment because on previous occasions he had come across cases attributed to this dye This was so because the same name often referred to dyes of very different composition, and unless the dermatologist discovered the precise composition of the particular product involved he was likely to be misled Describing some of the practical difficulties of carrying out investigations in industry, Dr Goldblatt said that the co-operation of managements and workmen could not be obtained unless the investigation did not interfere with production on the one hand and the morale of the workmen on the other The worker, already more than a little suspicious of medical service in industry, had to be handled with extreme care if useful results were to be secured In certain industrial conditions routine blood, urine, and *x*-ray examinations had to be performed on the workers, and the difficulty of organization and administration of schemes to effect these was not readily realized by medical men whose experience was limited to hospital or private practice

Dr DAVIDSON referred to old and new risks in old industrial methods, the new risks following new uses of old poisons, and the dangers of new industrial processes Mr H HEAP indicated how modern views on lead poisoning were being influenced by newer and more accurate methods of chemical analysis, and the need for estimating the many mineral elements that were normally found in the body

OESOPHAGEAL SURGERY

At a meeting of the Royal Medico Chirurgical Society of Glasgow on December 4th, 1936, with the president, Mr G H EDINGTON in the chair, Professor GREY TURNER gave a talk on oesophageal surgery, which was illustrated by lantern slides It was only possible, he said, to deal with some few aspects of the surgery of this out-of-the-way part of the body

Professor Grey Turner first referred to examples of achalasia or cardiospasm which had resisted treatment by dilatation and in which the patients were getting steadily worse He suggested that this condition was found in three stages (1) when it was simply a matter of neuromuscular imbalance, (2) later, when there was some superadded inflammatory trouble, and (3) still later, when inflammatory trouble had led to fibrosis producing an ordinary cicatricial narrowing He gave particulars of cases, probably belonging to Group 1, in which he had merely mobilized the lower end of the oesophagus and in which the patients had been very greatly relieved, although they still suffered occasionally from quickly passing attacks of what they called spasm On that account it would probably be better to combine with operative intervention the denervation of the lower end of the oesophagus, as advocated by Mr Knight In the cases which had gone on to a later stage improvement often followed gastrostomy, but of course that could never be allowed to be permanent, and he had made an anastomosis between the oesophagus and the cardiac end of the stomach in a series of cases with lasting good results

Cardioplasty

In the third group, where there was definite cicatricial narrowing of the lower end, a plastic operation of the nature of cardioplasty had also proved most effective Professor Grey Turner then spoke of the treatment of cases of simple cicatricial stricture in the middle of the oesophagus, which usually followed the swallowing of some corrosive poison He had dealt with six of these cases in which treatment by intermittent dilatation, often carried out by experts under oesophagoscopy, had not succeeded in bringing about lasting relief In his cases he had taught the patients to pass their own bougies and by great patience and perseverance on the part of the house-surgeons and nurses, as well as fortitude on the part of the patient, they had all succeeded so well that they might be looked upon as permanent cures After a time the improvement in the capacity of swallowing introduced a new automatic dilatation, which probably aided the permanence of the instrumental dilatation

Local News

SCOTLAND

Department of Health

Dr James L Brownlie, Chief Medical Officer to the Department of Health for Scotland, who was on sick leave for some time, has now resigned from this post, but his successor has not yet been appointed Dr Brownlie took up the post some four years ago in succession to the late Dr J Parlane Kinloch, having been at that time bacteriologist and pathologist to the county of Lanark A medical student of Glasgow University, he graduated M B, Ch B there in 1913, and after holding resident appointments in the Glasgow corporation hospitals proceeded to the D P H of Cambridge in 1916 and in 1918 to the M D of Glasgow, when his thesis on "The Problem of the Diphtheria Carrier" was highly commended He was for six years assistant bacteriologist in the laboratory of Glasgow corporation and for two years one of the medical officers in the Department of Health before taking up the post of bacteriologist to the county of Lanark He has contributed numerous papers to current medical literature

St Andrews Institute for Clinical Research

The seventeenth annual report of the Sir James Mackenzie Institute for Clinical Research at St Andrews dealing with the year to October, 1936, emphasizes the general purposes for which this Institute exists—namely, to investigate disease before the occurrence of structural changes in the body, to investigate symptoms and minor maladies, to study conditions under which patients live, and to conduct research into the early symptoms of consumption and of ill-health in children During the year sixty-two new cases were recorded and further notes were added to 967 cases already under observation A classification of the records at the end of the year showed that additions had been made in steady sequence to 52 per cent, while 25 per cent required bringing up to date and in 23 per cent contact with the patients had been lost In the children's department the Institute continues the records made up to the age of 2 years by the child welfare centre of the local authority and continues a series of notes on the children several times each year until these come under the school medical service The report claims that the organization of the Institute has anticipated many of the recommendations now made by the recent Departmental Committee on Scottish Health Services, for it has conducted during several years in St Andrews a medical

HIS MAJESTY'S COLONIAL SERVICE

COLONIAL MEDICAL SERVICE

It is anticipated that not less than 30 vacancies for Medical Officers will occur in 1937. The majority of these will occur in Tropical Africa and in Malaya.

QUALIFICATIONS—Candidates must be British subjects of European parentage under 35 years of age and must possess a medical qualification registrable in the United Kingdom. Preference will be given to candidates who have held Hospital or Public Health appointments or who have special knowledge of anæsthetics, radiology, surgery, medicine, ophthalmology, gynæcology, and midwifery, diseases of the ear, nose and throat, venereal diseases, etc.

SALARY—Initial salaries vary from £600 to £700 and rise by increments to a maximum of between £1,000 and £1,200.

PRIVATE PRACTICE—Private practice is not allowed as of right, but in the case of some appointments it is permitted on certain conditions.

QUARTERS—In Tropical Africa free quarters or an allowance in lieu are provided. In Malaya quarters are provided at an annual rental not exceeding 6 per cent. of the officer's salary.

PASSAGES—Free first class passages are provided on first appointment and when proceeding on and returning from leave. Assistance is also given towards family passages.

TERMS OF APPOINTMENT—The appointments are pensionable, subject to a probationary period which varies from two to three years.

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE—Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas.

DUTIES—Although Medical Officers are appointed in the first instance for general service there are opportunities for work in special branches of medicine and surgery, in public health and in medical research.

Further particulars and forms of application may be obtained from the Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S.W.1.

HIS MAJESTY'S COLONIAL SERVICE

Applications are invited for the post of CHIEF MEDICAL OFFICER, BARBADOS.

Candidates who must not be more than 48 years of age must be on the British *Medical Register* and should possess a Diploma in Tropical Medicine and Hygiene. Salary £1,000 per annum. The appointment is pensionable subject to two years' probation. Quarters and passage are not provided.

Further particulars and forms of application may be obtained from the Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S.W.1.

COUNTY BOROUGH OF BLACKBURN

PUBLIC ASSISTANCE DEPARTMENT

Applications are invited from Medical Practitioners (male) for the appointment of a RESIDENT JUNIOR ASSISTANT MEDICAL OFFICER at QUEEN'S PARK HOSPITAL AND INSTITUTION.

The Staff consists of a Resident Medical Officer, a Resident Assistant Medical Officer, a Consulting Surgeon, a Laboratory Assistant and an X-Ray Attendant.

There is a separate Infirmary, a separate Mental Block and a separate Sanatorium for children, and there is opportunity for experience in all departments, including Medical, Surgical and Midwifery cases. An X-Ray apparatus is installed.

The person appointed will be required to devote his whole time to the duties, and also to act as may be directed by the Resident Medical Officer.

The appointment will be limited to a term not exceeding one year.

Salary for the first six months at the rate of £150 per annum, and thereafter at the rate of £200 per annum, together with board, apartments, washing, [illegible] allifications and [illegible]ies of not more [illegible]mu t le ent so as to reach the Public Assistance Officer, Public Assistance Offices, Cardwell Place, Blackburn, not later than 10 a.m. on March 8th.

Town Hall, Blackburn. February, 1937.

CHAS. S. ROBINSON, Town Clerk.

COUNTY BOROUGH OF IPSWICH

MEDICAL OFFICERS OF HEALTH

The Council invite applications from persons not exceeding 45 years of age for the appointment of Medical Officer of Health for the Borough.

The commencing salary will be at the rate of £1,000 per annum together with a motor car allowance of £60 per annum.

The person to be appointed must be a legally qualified Medical Practitioner and registered in the *Medical Register* as the holder of a Diploma in Sanitary Science, Public Health or State Medicine.

The appointment will be subject to the approval of the Minister of Health and the Board of Education to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and to the successful candidate passing the necessary medical examination.

The person appointed must reside within the Borough. The appointment is terminable by three calendar months' notice in writing on either side.

The person appointed will be responsible for [illegible] imposed on the [illegible]er relevant the [illegible]l required to Acts [illegible]dmini trative act [illegible]ntendent of Town [illegible] Centres the Maternity [illegible]ospital and [illegible]officer to the Port Examiner of Entrants, and to perform such other duties as may from time to time be prescribed by the Council. He must devote his whole time to the duties of the office and will not be allowed to engage in private practice.

Forms of application and particulars with regard to the appointment may be obtained from the Medical Officer of Health, Public Health Department, Elm Street, Ipswich, and applications must be delivered to the undersigned not later than 12 noon on March 31st, endorsed "Appointment of Medical Officer of Health," in an envelope marked "Appointment of Medical Officer of Health."

Canvassing members or officers of the Council in any manner whatsoever is prohibited and will disqualify candidate.

Town Hall, Ipswich. February 27th, 1937.

V. MOFFAT, Town Clerk.

COUNTY COUNCIL OF MIDDLESEX

DISTRICT MEDICAL OFFICER AND PUBLIC VACCINATOR, SHEPPERTON AND LITTLETON

The County Council invite applications from duly qualified Medical Practitioners for the undermentioned appointment.

District Medical Officer for the Shepperton and Littleton Medical Relief District. Salary £50 per annum, plus the cost of expensive drugs and fees in respect of attendance at confinements and for the services of another Medical Practitioner to administer chloroform or other anæsthetic for minor operations (e.g., [illegible] fingers, abscesses).

The officer appointed will be required to carry out his duties in accordance with the Public Health Acts, the Vaccination Order, 1930, of the Minister of Health, to reside in the district unless the Council otherwise determine, and to name to the Council some duly qualified Medical Practitioner who will, in the case of his absence or other hindrance to his personal attendance, act in his place.

Public Vaccinator for the [illegible]o 54, Shepperton and Littleton Vaccination District. The person appointed will be required to produce to the Council a certificate of proficiency in vaccination, except in a case in which such certification was required as a condition of claiming any diploma, licence or degree which he possesses. He will be required also to enter into a written contract with the Council in accordance with the Vaccination Order, 1930, of the Minister of Health. The contract will provide for the payment of the scale of fees laid down by the County Council.

The person or persons engaged will not have any superannuation rights under the County Councils superannuation scheme.

Application, stating age, qualifications, and experience, accompanied by copies of not more than three recent testimonials, must be received by the undersigned not later than March 15th. Special application form, [illegible] provided. Envelope to be endorsed "Z. District Medical Officer and/or Public Vaccinator."

Canvassing directly or indirectly will be a disqualification.

C. W. RADCLIFFE, Clerk of the County Council. Middlesex Guildhall, Westminster, S.W.1. February 23rd, 1937.

President VISCOUNT WAKEFIELD OF HYTHE C C V O
Treasurer SIR LIONEL LAUDER-PHILLIPS Bart
Physician Supt J G PORTER PHILLIPS M D, F R C P

This Registered Hospital is now situated at Monks Orchard in some 250 acres of park pleasure and farm grounds. Applications can be considered on behalf of patients of the educated classes in a presumably curable condition

With a view to early treatment voluntary or uncertified patients are admitted

Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to admit patients free of charge

Every facility for specialized investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit In this unit is found A Ray and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories

Furthermore provision is made for Electro Therapy and Hydro Therapy to be carried out in all their forms and Occupational Therapy under competent instruction is encouraged

In addition to the Resident Medical Staff Consultants in special branches of medicine and surgery are available whenever required The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms

For forms and further particulars apply to the Physician Superintendent at the Hospital

NEW LODGE CLINIC, WINDSOR FOREST

J C GILBERT

service supported by laboratory and specialist services and based upon the work of the general practitioner The financial statement of the Institute shows for the year an income of £1 256 and expenditure of £1,461, but its assets amount to £15,389

District Nursing in Scotland

At the annual meeting of the Scottish Branch of the Queen's Institute of District Nursing held in Glasgow on December 18th Lord Provost John Stewart presided and Mr J M Vallance assistant secretary to the Department of Health spoke of the important work for the public carried on by district nurses He said there was now an army of over 900 fully trained nurses who played a great part in providing a health service for the country The county federation that had taken place during the past year had further strengthened the activities of district nursing associations With regard to the medical service for the Highlands and Islands the grants paid to nursing associations had amounted to £18 000 in 1935 as compared with £12 000 in 1925 and £6,000 in 1919 About 200 nurses were engaged in work in the Highlands and Islands, and the great success of medical service in this area was due to the complete co operation that existed between doctors and nurses The Maternity Services (Scotland) Bill now before Parliament was an attempt to solve the most serious problem that had confronted the Department for many years and Mr Vallance expected it would make a big reduction in infantile mortality He considered that it would also strengthen voluntary nursing associations by arrangements between them and local authorities Lady Susan Gilmour, secretary of the Scottish Branch said she expected that district nurses would do their share in helping the national work of reducing deaths among mothers especially in the country areas District nurses during the past year had attended 14 521 maternity cases or one sixth of the total for Scotland and the mortality amounted to 3 5 per 1 000 births as compared with 6 8 of cases otherwise attended

ENGLAND AND WALES

The University College Hospital Extensions

Extensions of University College Hospital Gower Street, close to the new home of the University of London, were opened last month by the Duke of Kent The extensions comprise a paying patients' wing a new ante natal and infant welfare department, an x-ray diagnostic department, and homes for the nursing and domestic staff In performing the ceremony the Duke of Kent emphasized the importance of the provision for paying patients, mentioning that University College Hospital had not been as fortunate as some other institutions in finding a generous donor to provide such accommodation, and therefore had taken upon itself the responsibility of erecting the building Sir Herbert Samuelson, chairman of the hospital stated that the new extensions had cost about £300 000 two thirds of which had still to be raised The new wing for paying patients claims to be one of the finest of its kind ever erected Accommodation is provided for seventy seven patients, all of whom are housed in separate rooms except in two four bed wards which can be converted into separate cubicles when desired All of them are attractively decorated and some which have a south-westerly aspect have large balconies suitable for open air treatment. On the ground floor, in addition to reception waiting and consulting rooms and offices the new x ray department is installed The operating theatres of which there are three with ancillary accommodation and the pathological laboratories are situated on the sixth floor The hospital is said to be the first in the country in which all the theatres and sterilizing rooms and indeed all the seven floors, are equipped with an automatic supply of constant running hot and cold distilled, and sterile water The air which comes into the operating theatres is filtered and passed through radiators to warm it An alternative system of lighting is provided coming on automatically in the event of breakdown of the main supply On the top floor there is a solarium for convalescent patients and a space which can be used for a badminton court for the nurses and for exercise for the patients The new ante natal and child welfare department which was opened in part, is another example of careful planning The post natal clinic includes four examination rooms with three cubicles for suspected cases of infectious or contagious disease, and these are so arranged as to have direct access to the street, in order that such cases can be removed at once by ambulance without retracing their way through the department

Leeds Students' Union

It has for long been an aspiration on the part of the authorities of the University of Leeds and of the past and present students that adequate accommodation should be made for the Students Union When the great scheme for the extension of the buildings of the University was launched a scheme which has been recently referred to in these columns (*Journal* December 19th 1936 p 1252) this was one of the objects mentioned The sum of £50 000 was spoken of as necessary for the purpose The matter was taken up by the past and present students and a sum of about £4 000 has been collected Nothing is more likely to encourage generosity on the part of those who have the welfare of the students at heart than action of this kind and it may well have been this that influenced Mr W Riley-Smith of Tadcaster to give £25 000 towards the scheme last June At the annual dinner of the Leeds University Old Students Association which was held on December 19th 1936 it was announced that a Treasury grant of £15 000 had been voted towards the object Plans have been in readiness for some time and will soon be put in hand An excellent site has been secured within what will be the ring fence of the greatly extended university buildings As the distance between these and the more strictly medical buildings such as the Medical School, the Institute of Pathology the School of Dentistry and the General Infirmary is not great it is hoped that these Union buildings may act as a stimulus to that intimate relationship between all the faculties which is the essence of a university

Medical Society of London

The second half of the 164th session of the Medical Society of London opens on January 11th with a pathological meeting at 8 p m Discussions will be held at 11, Chandos Street W at 8 30 p m as follows January 25th value of experimental and laboratory training in medical education, February 8th treatment of facial paralysis, February 22nd, aetiology and diagnosis of jaundice March 8th, effects of prolonged dorsal decubitus, March 22nd consideration of some occupational diseases The Lettsomian Lectures on Surgery of the Thyroid Gland will be delivered by Sir Thomas Dunhill on February 15th and 24th and March 1st at 9 p m The annual general meeting will be held on May 10th at 8 p m and will be followed by the Annual Oration on Perspective and Poise in Practice by Dr R A Young and a conversazione

Birmingham Health Congress

The Earl of Dudley will preside over the Health Congress of the Royal Sanitary Institute at Birmingham from July 12th to 17th The Minister of Health (Sir Kingsley Wood) will address a general session on July 13th The deliberations of the Congress will be divided among eight sections dealing with preventive medicine, engineering architecture and town planning, maternity, child welfare and school hygiene veterinary hygiene national health insurance hygiene in industry, tropical hygiene sewage disposal There will also be conferences of representatives of local authorities medical officers of health engineers and surveyors sanitary inspectors and health visitors

Correspondence

Metabolic Factor in Rheumatism

SIR,—I see from the article by Dr R G Gordon in your issue of December 19th, 1936, that we are returning to the conception I have advocated for the last twenty years—namely, that in chronic rheumatism a series of external factors—meteorological, dietetic, mental, toxic, and infective—acting on a specially predisposed individual disturb first of all the regulators of metabolism (the endocrines, including that most important endocrine the liver, the vegetative nervous system, and the psycho-associational cortex), and thus determine metabolic disturbances which, acting on the tissues of the joints, cause the terminal lesions of chronic "non-specific" arthritis The fundamental error which has encumbered research on rheumatism during recent years consists in having taken the part for the whole, and thus having laid undue stress on the infective factor (one of the external factors) and concentrated on an exaggerated pigeonholing of the terminal results of the disease—the arthritic localization Recent work confirms the importance of the metabolic factor and the necessity of considering the rheumatic patient as a whole and not from an exclusively bacteriological or anatomical point of view

Two points must be stressed in consideration of the metabolic factor in chronic rheumatism The first point is that metabolic disturbances are not uniform Every individual, and therefore every rheumatic, experiences psycho-neuro endocrine reactions, and thus metabolic disturbances according to his own special psycho-neuro-endocrine constitution For this reason, as I pointed out in my communication to the International Congress for Rheumatism in Moscow, we find in certain rheumatics a low basal metabolism, in others a high one, in some a low blood [illegible] in others the contrary [illegible] one The second point is that among the metabolic disturbances found in chronic rheumatics are included those which manifest a special inadequacy of the joint tissues, and these are important because they explain the localization of the general disturbance on the joints Sulphur is an important element in the local metabolism of the joints Derangement of the regulators of sulphur metabolism indicates an inadequacy of the local resistance of the joints This explains the frequency with which a disturbed sulphur metabolism is found in chronic rheumatics—a frequency accepted by most authors since my first work on the subject—and also the efficacy of sulphur spas and sulphur treatment, including gold treatment, which, in fact, is treatment by gold plus sulphur—I am, etc,

London, W 1, Dec 22nd, 1936 A P CAWADIAS

SIR,—Dr R G Gordon's article on rheumatism in the *Journal* of December 19th, 1936 (p 1243), interested me from the stress laid on the metabolic aspect

For some time I have noticed that certain cases of acute lumbago show definite urinary changes very suggestive of a gouty metabolism These are demonstrated by a lateritious deposit a *p*H value of 5 to 5·4 as measured by the B D H capillator and an increased frequency caused by the hyperacidity The local findings in these cases have been tenderness and a bilateral fibrositis so far as I remember (unfortunately I have no notes) The underlying pathology is presumably an increased acid formation in the muscles which acid is retained unduly long owing to deficient circulation caused by the fibrosis pressing on the blood vessels This fibrosis may of course in the first place be induced by faulty metabolism thus causing a vicious circle so far as local symptoms are concerned

The metabolic aspect of these cases is supported by the symptomatic relief following the exhibition of iodides and alkalis This does not deal with the fibrositis, which requires physiotherapy for its dispersal—I am, etc,

I H LLOYD-WILLIAMS, M B, B S

Southport, Dec 20th

Blood Transfusion

SIR,—Mr P L Oliver has made the suggestion that a national blood transfusion conference should be held at which those who have had experience of this method of treatment should exchange views and draw up a series of recommendations (*Journal*, November 21st, 1936, p 1032) Such a conference is long overdue, and it is to be hoped that it will be convened without delay

There is at present a great deal of confusion of thought on this subject Statements originating from the time when blood transfusion was a rare and exciting adventure have been reproduced in the textbooks from one edition to another Isolated cases of transfusion accidents are reported from time to time, and we are invited to draw conclusions from them Reports of cases that have been transfused by inexpert operators can do nothing but confuse the issues I hope Dr N S Plummer will take no offence if I cite as an example one of the cases in his interesting and able report in the *Journal* of December 12th, 1936 (p 1186) A woman with advanced mitral stenosis was given 600 c cm of blood in one transfusion Criticism without full knowledge of the circumstances can serve no useful purpose, but Dr Plummer himself expresses the opinion that probably this case was unsuitable for transfusion, and surely if a transfusion was necessary the quantity given should have been very much smaller One cannot help wondering whether some other imperfections of technique may explain the accidents in some of the other cases quoted

Dr Plummer states that 50 per cent of transfusions are followed by some sort of reaction I would submit that with a proper technique only about 5 per cent of cases have any reaction at all, and most of these are very slight In over 400 transfusions carried out here in the past thirteen years there were only two fatalities which could be ascribed to the transfusion Both these cases were bad risks in which transfusion was undertaken as a choice of evils One was a case of carcinoma with femoral thrombosis, the other was a man of 86, a case of haematemesis Although in a straightforward case blood transfusion is a comparatively simple procedure there are numerous pitfalls for the inexperienced operator The use of blood which has been overheated or blood containing microscopic and even macroscopic clots, stale saline, or citrate, the use of imperfectly cleaned rubber tubing containing a film of old blood from a previous transfusion, and too rapid injection of the blood—these are some of the mistakes to be guarded against, and some of them are not yet universally appreciated

In many hospitals blood transfusion is not a particular duty of any single member of the staff, and since it is time-consuming and is often an emergency procedure it is frequently left to the house-surgeon to carry out This may often be an unavoidable necessity, but my point is that no conclusions should be drawn from reports of transfusion accidents unless the operation was carried out

Now the filter tip is cork or plain.

du MAURIER **Medium**, in the blue box . . . for those smokers who prefer a medium cigarette.

The filter tip is made from a five layered material composed of three layers of pure white vegetable tissue interleaved by two layers of cellulose fibres

Choice of plain or cork tip is a matter of personal preference So is the choice of a mild or medium cigarette ¶ The new "du Maurier" (easily recognised by the blue box) gives to habitual "medium" smokers a plain tip cigarette with all the advantages of the familiar "du Maurier" filter Only the pure smoke of finest Virginia tobacco passes the lips—no bits in the mouth

du MAURIER

the perfect cigarette with the exclusive filter tip

PRESCRIBING HEAT WITH SAFETY

An Innovation —and an Invitation!

Even in cases where normal hot water baths are contra-indicated Zotofoam treatment may safely be prescribed For Zotofoam—by utilizing the remarkable insulating properties of scientifically produced foam—can induce rapid, intense perspiration, and in certain cases may be accompanied by a fall in pulse rate and blood pressure

The patient, immersed to the neck in soft, light foam, and breathing air of normal temperature, experiences no feeling of pressure or oppression, but enjoys a definite sense of stimulation, enhanced by the gentle massaging action of countless micro bubbles which constantly burst and re-form against the skin

Pine brine, sulphur, oxygen, CO_2, etc., may all be given in conjunction with Zotofoam Equipment may be installed in any ordinary slipper bath
Doctors are invited to enjoy a demonstration Zotofoam treatment in their own home at any time Use the Appointments Form below

To SOAPLESS FOAM LIMITED
17 18 Dover Street (T 8) London W 1

Not an *Ordinary* DEAF AID

but a SCIENTIFIC Instrument Recommended by Eminent Medical Men

Amplivox Deaf Aids have secured the unqualified approval of famous specialists and well known medical practitioners because they give genuine high fidelity reproduction at really long range Strain and distortion have been eliminated and a frequency range of from 50 to 6 000 cycles per second secured Moreover the Amplivox is suitable for all types of deafness and thanks to the use of special midget valves, is no larger than a box camera Let me send you a copy of the Amplivox brochure containing striking testimony from satisfied users I will gladly arrange for your patients to try an Amplivox for a week in their own homes

Comparative Vitamin 'B' Content in Bread

The question as to what form of bread provides most completely and economically the essential Vitamin 'B' has now been settled by independent experiments

It has been shown that HOVIS by reason of its high wheat-germ content, is richer than either white bread or wholemeal in this vital food-element This is due to the fact that 25% of the flour from which HOVIS is produced consists of wheat-germ—the source of Vitamin 'B' The great value of HOVIS is that it contains all the elements of a complete food and is easily absorbed Furthermore, the low starch content renders it very digestible especially for convalescents and those whose vitality is low

More nutrition Greater digestibility

Vapo-Cresolene
Et 1879

Vapo-Cresolene, specially prepared from creosoles of coal tar, soothes and relieves asthma, whooping cough, bronchitis, spasmodic croup, chest colds, and throat catarrhs Laboratory tests, by a research laboratory of unquestioned standing, show that the vapours produced from Vapo Cresolene by the Cresolene Vaporiser exert a direct germicidal action when in contact with moist surfaces harbouring pathogenic bacteria associated with respiratory affections Sedative, anti-spasmodic and penetrating, Vapo-Cresolene may be used to maximum advantage while the patient sleeps Vapo-Cresolene has enjoyed its reputation as a dependable inhalant for over 57 years and is invaluable for the treatment of children

SULPHAQUA is stocked by the leading Wholesale Houses in Canada Australia New Zealand South Africa, India U S A

by someone experienced in the method Mr Oliver's suggestion that transfusions should be carried out by men specially trained in that work should certainly be more generally adopted Moreover, when the work is centralized as it is in this hospital, and several transfusions are done every week, it becomes possible to keep a supply of blood from a universal donor in the ice box ready for emergencies thus saving much valuable time

Among the problems urgently calling for solution are the following

1 A simple method of storing blood without sacrificing the plasma

2. The relative merits of citrated defibrinated, and whole blood

3 The advantage of a number of small transfusions rather than a single transfusion in the various types of case

4 The safety or otherwise of repeated transfusions from the same donor

5 The most satisfactory technique

From my own limited experience it seems that ordinary citrated blood may be stored in the ice chest for one to six days with safety provided it is well mixed with the citrate both during and for some minutes after collection It has been stated that defibrinated blood is toxic but after using it in 150 cases I have failed to observe any evidence of this The work of Wright suggests that the use of defibrinated blood has advantages over the citrate method in all cases in which one is endeavouring to increase immunity to infection

To my mind it has not yet been proved that there is any danger in repeated transfusions from the same donor I have done it scores of times without observing any ill effect If such reactions do occur possibly the interval between transfusions may here be of importance as in the case of serum anaphylaxis

The simplest technique is usually the best but methods involving the use of rubber tubing have two disadvantages Unless the blood is heated to an undesirably high temperature it is nearly cold by the time it reaches the vein Further, the inadequate cleaning of rubber tubing is a most complicated process I have found the simplest satisfactory apparatus is a 100 c.cm Record syringe with a Harrison's tap on the needle After injecting each syringeful the tap is turned off and the syringe detached, to be refilled by the nurse In this way blood can be given at body temperature

The suggested conference might do much to elucidate some of the points I have mentioned and indicate the directions in which further research is required—I am etc,

R VAUGHAN FACEY
Honorary Bacteriologist Royal Victoria and West Hants Hospital Bournemouth

Bournemouth Dec 21st 1936

SIR—Dr N S Plummer, in his recent report of six fatalities following blood transfusions, writes Ordinary precautions had been taken in the preliminary tests and in the performance of the operation He makes no mention however of the method used nor of the length of time taken in giving the transfusions

It is now I think, agreed that it is safer in all cases especially in those suffering from disease of the heart muscle or with anaemia to give the blood slowly, taking at least an hour for a transfusion of a pint In order to do this satisfactorily some kind of drip apparatus is needed and the Laurie glass drip is most satisfactory The simple tube and funnel method should never be used since it is difficult for the blood to be given slowly Its only virtue is its simplicity, but this is outweighed by the increased risk In a patient with a defective heart muscle it is more than likely that if a pint of fluid is introduced quickly into the blood stream the circulation will become embarrassed, in which case pulmonary oedema and heart failure may easily follow For some years I have used the slow drip method in giving blood transfusions, and febrile or anaphylactic reactions have been markedly reduced in number and greatly lessened in severity Rigors and severe reactions are practically unknown now

It is, however, with patients suffering from anaemia especially of the haemolytic variety, that great care has to be taken to avoid these reactions since in these cases such reactions are liable to be very severe and even dangerous Therefore in order to use with safety blood transfusions which are so valuable for these cases the blood of the same group as that of the patient should be given and besides the testing of the recipient's serum against the donor's red corpuscles the patient's red cells should also be tested against the donor's serum The transfusion should then be given slowly at a rate of no more than three drops of blood per second

If blood transfusions continue to be given quickly severe reactions and fatalities will continue to occur—I am etc,

Derby Dec 24th 1936 F GRAHAM LESCHER

A Problem in Diagnosis

SIR—Under the heading Clinical Memoranda in the *Journal* of December 26th Mr H Bernard Bagshaw discusses a problem in diagnosis Summarized, the notes of his case are as follows

A man aged 50 received multiple injuries to his head arm and leg He was unable to pass water The lower portion of his abdomen was guarded but not rigid there was dullness but no distension A rubber catheter was passed following an attempt with a gum elastic catheter and 50 ounces of blood stained urine were withdrawn The temperature and pulse rate remained normal The inability to pass urine persisted and a catheter was tied in and drained 60 ounces in the day When the catheter was removed micturition was still impossible and an instrument was passed every three hours The amount withdrawn per diem was 60 ounces Vomiting and increased abdominal pain supervened He died six days after admission Post mortem a large rupture of the fundus of the bladder was found At no time were there the usual signs of the acute abdomen and the pulse rate did not rise for three days after the accident. Mr Bagshaw thinks that it is possible that the catheter passed per urethram and entered the hole in the bladder and that in reality the general peritoneal cavity was drained on each occasion

I published the notes of a similar case in 1928 (*Injuries to Bones and Joints*) It was then pointed out that the onset of peritonitis, cellulitis and suppuration with accompanying rigors rise of temperature and general symptoms of toxaemia may be delayed for a period of two or even three days in cases of leakage from the urinary bladder containing healthy urine

The case in question was seen in France at a casualty clearing station in 1916 The man had fallen from the roof of a house and fractured his jaw bone and both forearms He had abdominal tenderness and made ineffectual attempts to pass water A fracture about the pubis was suspected but not confirmed and a ruptured bladder diagnosed On passing a catheter however a full quantity of blood stained urine was withdrawn This appeared to justify delay especially as the pulse remained about 80 and there was no rise of temperature The inability to urinate continued A catheter passed every four hours resulted in the withdrawal of normal quantities of unstained urine Blood was only present on the first occasion Twenty four hours after admission vomiting

commenced and abdominal rigidity was more marked The abdomen was opened and a large rent was found in the fundus of the bladder There was a quantity of urine without odour lying free in the abdominal cavity While the abdomen was open a catheter was passed, and it then became obvious that on every previous occasion the instrument went through the rent in the bladder and that, in fact, extravasated urine had been withdrawn The rent was stitched and the abdomen closed without drainage Notwithstanding the multiple injuries and the delay of twenty-four hours the patient did well

The case is in all relevant respects similar to that published by Mr Bagshaw The first diagnosis was correct, but the result of catheterization was so confusing that there was uncertainty and delay There is little doubt that the catheters passed by Mr Bagshaw went through the tear in the bladder into the general peritoneal cavity He has done a service in drawing attention to a certain group of cases in which the success of repeated catheterization may be more apparent than real I think we should suspect ruptured bladder after trauma when the urine is in the first instance blood-stained and when the inability to pass water persists Catheterization and the general condition of the patient may mislead us for two or three days—I am, etc,

London, W 1, Dec 26th, 1936 W I DE C WHEELER

Mechanics of Glaucoma

SIR,—There are several objections that may be raised to the theory expressed by Mr Richard Kerry in your correspondence columns of December 19th, 1936, but the chief one is the absence of any other evidence of cyclitis in acute primary glaucoma An eye suffering from this condition, submitted to operation such as iridencleisis in the acute stage, whitens rapidly without the appearance of precipitates on the cornea or haze of the aqueous fluid

The appearance is very different when glaucoma develops secondary to cyclitis, and whereas the raised tension of an acute glaucoma does vast damage in a short while, that of glaucoma secondary to cyclitis, although maintained over a long period, commonly leaves no adverse effects—I am, etc,

Hull, Dec 19th D STENHOUSE STEWART

Diphtheria Immunization

SIR,—I have just read an extraordinary communication in your issue of December 12th, 1936, from Dr C H Foley (p 1230), in which he refers to anaphylactic shock following the first of three diphtheria prophylactic injections He states that this phenomenon is an objection to the three-injection method of prophylaxis, and refers to the increase of this anaphylactic tendency owing to the use of prophylactic diphtheria antitoxin in contacts He seems to think that when such subjects are subsequently immunized they are liable to develop anaphylactic symptoms

My personal experience of giving repeated injections of prophylactic must amount nearly to the six-figure mark during the last twelve years or so, and many of the children so treated have had antitoxin previously I have never once, during all that time, had to use adrenaline in the treatment of any disturbance due to a second, third, or, in fact any other prophylactic injection, nor have I ever even had to consider its use I think it would be interesting if Dr Foley would tell us, first, what is his definition of anaphylaxis, and secondly, what prophylactics he has used which have produced the symptoms he complains of For years I have worked with a variety of brands of toxoid-antitoxin mixture and toxoid-antitoxin floccules all of which contain a small amount of serum The instances in which any reaction of sufficient severity to demand discontinuance of treatment has occurred are so few as to be negligible

My view is that reactions are more common and more severe following the use of alum-precipitated toxoid than is the case with any other prophylactic, except strong formol toxoid, whatever the past history of the subject as regards previous diphtheria or passive immunization I am quite unable to reconcile Dr Foley's experiences with my own, unless he and I have a totally different conception of the meaning of the term anaphylaxis—I am, etc,

GUY BOUSFIELD, M D, B S Lond

London, S E 5, Dec 21st, 1936

Regions of the Mind

SIR,—In view of the special interest taken in psychology and the frequent reviews of textbooks and other works on this subject in the *British Medical Journal* it may be worth while to quote from a letter I received in 1904 from the late Dr Alexander Hill, relating to the definition of the "soul" or "spirit" Dr Hill was then the Master of Downing College He stated

"Alfred Russel Wallace stood alone amongst evolutionists in accepting an evolutionary origin of all animate things other than man He required a separate origin for man Subsequently he recognized, as everyone must, that man's body is an adaptation from that of four-footed and creeping things, but still holds out [he died in November, 1913, aged 90] in what is quite an incomprehensible way for a difference in kind between the mind of animals and the mind of man No true evolutionist can even think of such a separate origin, but we—most of us—find no difficulty in supposing that all man's faculties are products of evolution We have to fit man into the animal series as best we can As to St Paul's 'spirit' or Aristotle's cognitive soul,' the conception does not differ widely from the modern 'ego' Ward says, 'No system of philosophy can afford to extrude the ego,' and such a standpoint satisfies most of us It leaves a very open door"

This is what Hill wrote a third of a century ago Since that time the study of psycho pathology has stressed the teaching that there are two separate regions of the mind—one comprising the unconscious, or the primordial impulses and the instinctive urges that strive for relief but are mostly unrecognized, the other, the conscious region, which, after deliberation, directs the decisions expressed in the general conduct Freud described the former as *impersonal* and referred to its place in the mind as *it* (or the Latin *id*), which, for his pupils, is its present identification mark The conscious part of the mind, or the critical attitude, he described as the "ego," and he added that there was a perpetual struggle on the part of the unconscious inherited impulses to reach the "ego," but these impulses (most of them connected with the instinct of self-preservation) are often kept back or withheld by the so-called censor, or the super-ego which is the third adjustment, and described as the "soul" or "spirit"—namely, the personality which endeavours to bring inner perceptions or the subjective life into harmony with external reality or objective sense perceptions It is clear that Dr Hill regarded the "soul" or "spirit" as the mind in its moral and religious aspects, which means the mind in the contemplation of higher things The "ego" is no new conception It is the splitting up of the "ego" which has become the vogue to-day We are in a period when analysis is rife—a schizoid era, afflicted with schizophrenia—I am, etc,

H.C.I
(EVANS)

Hepatex Compound Intramuscular

HCI (Evans) is a powerful stimulant to the haemopoietic system in debility, physical inertia, and convalescence from exhausting illness

Formula —

Neo Hepatex	*0 8 cc*	
Iron arsenate soluble	*0 03 grm*	*in 1 cc*
Strychnine nitrate	*0 0005 grm*	
Sodium glycerophosphate	*0 045 grm*	

Each 1 cc. ampoule contains 0 00043 grm (gr 1/150 approx) of Arsenic trioxide

One of the most important attributes of Hepatex Compound Intramuscular is the rapid manner in which it regenerates the blood after haemorrhage It is obvious that the liver substance which it contains must exert a beneficial influence on the whole condition by reflex action through its haemopoietic properties

Hepatex Compound Intramuscular is issued in 1 cc ampoules for intramuscular injection

DOSAGE —The recommended dose is one or two ampoules daily

Issued in boxes of 6 × 1 cc ampoules per box 4/
12 × 1 cc „ „ 7/
100 × 1 cc „ „ 42/

Modern Dermal Therapy
WITH
BELZEMA
BRAND OINTMENT

ILLUSTRATED BY AUTHENTIC CLINICAL REPORTS

I have been using Belzema Ointment for some time on my Infantile Eczemas with most gratifying results

★ ★

Belzema Ointment seemed to do the trick without the need of unsightly bandaging of my hands and smearing them up with greasy dirty applications

The free sample has worked wonders with one stubborn case of Eczema

★ ★

Am securing most remarkable results from use of your Belzema Ointment and Soap in 3 cases Psoriasis (all having a duration of 5 years on average) 2 of Acne and 5 Dandruff (Seborrheic Dermatitis)

Have been using your excellent ointment on a variety of skin diseases with very nice results

★ ★

Have practised medicine for over 45 years but never met with a remedy to equal your Belzema Ointment in treatment of Eczema

BELZEMA is readily ABSORBED — NON STAINING — NON GREASY — ANTI PRURITIC — ANTI SEPTIC — ANTI PARASITIC — NO BANDAGING REQUIRED

BELZEMA is a purely ethical product—its advertising and propaganda is conf ned absolutely to the Medical Profession and the fullest co operation of its manufacturers and ourselves may be expected

EVERY PHYSICIAN SHOULD TEST BELZEMA

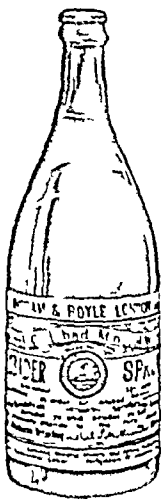
KNOWLEDGE YET TO COME

There are still questions to be answered concerning the state of acidosis But studies of the mineral requirements of the body confirm the need of an increased supply of alkaline salts in acidosis from respiratory infections, infectious diseases, nephritis, rheumatic fever, cyclic vomiting, general anæsthesia, pregnancy and certain skin diseases

This need is supplied by ALKA-ZANE, a palatable effervescent salt, supplied in 4 ounce bottles.



Trial supply sent to Physicians on request

FOR EFFECTIVE AND SAFE ANALGESIA

To the patient's plea for something to relieve headache, neuralgia, sciatica, lumbago, the pains of myalgia and arthritis, or the periodic suffering of women, there is no more effective answer than a prescription for VEGANIN. A trial of this synergistic combination of acetylsalicylic acid, phenacetin and codeine will demonstrate its analgesic superiority over that of the individual drugs administered separately. Moreover, with Veganin, there is no systemic disturbance, no habituation, it is perfectly safe in the patient's hands.

Veganin Brand Tablets are supplied to the public in tubes of 10 and 20, boxes of 100 for the Medical Profession only.

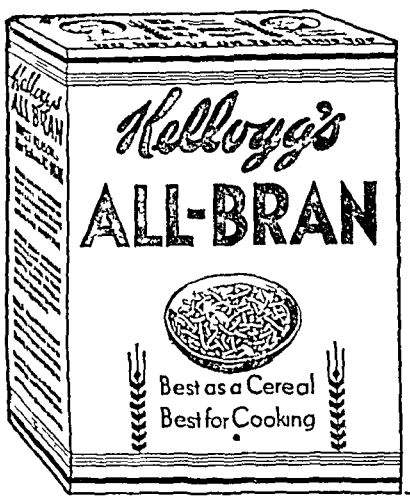
A step in the right direction

New Cocoa process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here Because it achieves this end without adding one penny to the cost of meals, we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man

This new predigestion process makes for improved nutrition in two ways —

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly It now makes even milk three times as digestible The increase in digestibility is particularly noticeable with the enzyme erepsin, making this improved cocoa particularly beneficial to children Practically no indigestible protein now passes into the large intestine, thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided



2 The protein in Rowntree's Cocoa is now more digestible than that in other cocoas This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children

* * *

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way The price is also unchanged

OVALTINE

AN AID TO HEALTHY DEVELOPMENT

MODERN medical research makes it increasingly clear that abnormalities of form, mental defects and even permanent constitutional weakness are often a direct result of failure to obtain in infancy a diet adequate to the physiological needs of the organism The basic necessity, therefore, in constructing the dietary of the infant and growing child, is to ensure one that is complete in all the essential food elements

Ovaltine finds one of its most valuable applications in this direction Composed of the nutritive constituents of fresh, full cream milk eggs and malt, in well-balanced proportions, it supplies calcium, phosphorus vitamins and other accessory food factors and its regular addition to the ordinary diet of the child renders this safe and adequate

Ovaltine is so delicious and easily digested that it can be prescribed with complete confidence for children of all ages Ovaltine is easily prepared and is most economical

Cystopurin

The ideal urinary antiseptic for oral administration!

From information received —

"I have had an interesting experience with Cystopurin in a case of inoperable carcinoma of the bladder in a male aet 67 After a month's X-ray treatment he was in a very exhausted condition and contracted a very acute Cystitis with strangury and micturition every 15 minutes I put my patient on Cystopurin tab one t d s, but on the advice of the consultant changed to —— The strangury was becoming worse and the question of a suprapubic cystotomy was being considered and sedatives, including opiates, had to be administered in considerable quantity I reverted to the Cystopurin, and within a week the patient's condition had vastly improved Temperature became normal, pulse rate settled and the strangury gradually subsided Now, after just under four weeks, my patient is up and dressed and passes sixty ounces of urine daily, at intervals of not less than three hours This improvement has been manifest in spite of the presence of an inoperable cancer I have no doubt that the condition of malignancy has improved following the X-ray treatment, but the clearing up of the Cystitis under very unfavourable circumstances in an exhausted patient suffering from malignant disease is most interesting'

NOVASORB

A Pure Magnesium Trisilicate with Exceptional Adsorbent and Antacid Properties

Novasorb forms a rational treatment in dyspepsia, gastric discomfort due to hyper-acidity, and ulceration of the gastro-intestinal tract

As it cannot cause alkalosis nor generate carbon dioxide it has important advantages over the bicarbonates

Dosage —One or two teaspoonfuls in water between meals with an additional dose whenever the discomfort recurs

NOVASORB is issued in bottles —
3½ oz 2/6 8 oz 4/9 16-oz 9/ 5-lb 40/
(dispensary size)
Also in Tablets tins of 48 2/3

The treatment of

acute inflammatory conditions

There is abundant evidence, which has accumulated over a period of more than a decade, of the value of S U P 36 in the treatment of acute conditions in which pyrexia is an outstanding symptom

Its value in influenza has been demonstrated repeatedly in epidemics of this infection, whilst in pneumonia and broncho-pneumonia the effect of one or two injections of S U P 36 has been described as 'dramatic' In certain skin affections also, and in such localised infections as lymphangitis, mumps, measles and chicken-pox, the administration of S U P 36 is highly recommended inasmuch as its injection reduces the virulence of the disease and tends to mitigate the effects of the usual complications

VITAMIN B_1 : 5,700

While Bemax is the standard Vitamin B_1 supplement for the ordinary diet, Vitamin B_1 (Bekailin Brand) is indicated whenever the desired dose of the Vitamin is higher than can conveniently be administered in a natural food For example, the neuritis of pregnancy has been relieved by Vitamin B_1 (Bekailin Brand) in doses of 1,500-2,250 units daily (*Lancet*, April 11, 1936, p 835) For such massive doses a concentrate must be used Vitamin B_1 (Bekailin Brand) is an active adsorbate which is biologically assayed and standardized to contain 200 units per gram (5,700 per oz) Prepared in the form of 0 5 gram tablets, it is convenient for oral administration Recommended in ARTHRITIS, NEURITIS, ULCERATIVE COLITIS, AND DIABETES

Vitamin B_1 (Bekailin Brand) is a reliable preparation of high potency at a moderate cost.

VITAMIN B_1

(BEKAILIN BRAND)

PROFESSIONAL PRICE 8/- for 100 tablets

[100 International Units per tablet]

Obtainable from THE BEMAX LABORATORIES (address below)

B_{II} : 400

No one would think of prescribing, for example, insulin of unknown potency or non-standardized Vitamin A or D preparations Why then prescribe non-standardized Vitamin B_1 preparations? Not only is Bemax standardized at 400 International Units per ounce, but it is also stable over a period of years, *i e*, its potency does not deteriorate with age Such statements cannot be made in respect of any other natural source of Vitamin B

Providing as it does the unique combination of a *natural* yet *standardized* source of Vitamin B_1, Bemax is used as a routine in PREGNANCY, LACTATION, DEBILITATED STATES IN CHILDREN, DIGESTIVE DISTURBANCES and CONSTIPATION Vitamin B therapy in the form of Wheat Germ (of which Bemax is a stabilized and standardized preparation) is recommended by the Committee of the British Medical Association for FIBROSITIS and ARTHRITIS

In addition to its high Vitamin assay, Bemax is a unique source of accessory nutritive factors for the optimum protective diet (See table below)

BEMAX

Vitamin B_1—400 International Units per ounce

Vitamin B_2—Flavine present B (anti-dermatitis) one of the richest sources

Vitamin E—the richest known food source

Phosphorus—330 mg per ounce

Magnesium—09 mg per ounce

Iron—3 mg per ounce (70% available iron)

Copper—0 45 mg per ounce

Fibre—less than 1 5%

E : ?

While a standardized source of Vitamin E does not yet exist, the physician will naturally turn to the richest supply The most recent activities in research on Vitamin E point to wheat germ oil as the richest source Now that it has been established that human sterility and habitual abortion, when not due to pathological conditions or anatomical abnormalities, may sometimes be traced to a dietary deficiency of Vitamin E, the use of Fertilol—wheat germ oil—is to be preferred The Vitamin E activity of Fertilol does not deteriorate with keeping Administration over a period has no ill-effect The dose recommended for patients is one to three 5 minim capsules daily for a minimum period of three months

PROFESSIONAL PRICE

12/- per 100 5-minim capsules

Benzedrine

SIR,—Your article on the use of benzedrine (December 12th, 1936, p 1204) prompts me to send the following brief notes

The patient was a man aged 40 giving a history of an attack of bradycardia associated with low blood pressure in March of this year On October 8th he complained of a depressed sinking feeling and was very irritable wanting to shriek when upset There were heavy stupefying headaches and attacks of exhaustion and somnolence The blood pressure was 110/74 mm Hg pulse rate 84 I ordered him tablets of benzedrine sulphate (Menley and James) the doses to be adjusted according to the subjective results On October 26th he reported that his sleep was interfered with though at times he was conscious of increased energy Diurnal somnolence was banished and there were no attacks of depression but he occasionally felt dizzy his systolic blood pressure was 90 mm Hg On November 9th he was able to manage the dosage so that interference with sleep did not occur He was conscious of great heaviness and tiredness in the mornings then on taking the tablets after breakfast he was braced up for some hours blood pressure 96/70 mm Hg On November 28th he was taking three tablets daily any larger dose caused sleeplessness He noticed increasing difficulty in voiding faeces and urine and was conscious of something holding them back Exhaustion was less severe but still present at times blood pressure 106/76 mm Hg

I decided to abandon this particular form of experimental therapy and put him on a good old fashioned mixture of potassium bromide and compound syrup of iron and phosphorus On December 12th his blood pressure was 112/74 mm Hg He said that he felt more equable and more sure of himself

In this case the drug appears to have acted in ways contrary to those usually described The fall in blood pressure was striking under the circumstances and the apparent spasm of his sphincters about which his information was wholly voluntary, is difficult to explain—I am, etc,

DONALD M O CONNOR.

London S.E.21 Dec 17th 1936

The Anaesthetist in the Theatre

SIR—Anaesthetists needs were discussed by Dr George Edwards at the meeting of the Section of Anaesthetics of the Royal Society of Medicine on December 4th and reviewed in the *Journal* of December 12th 1936 (p 1204) Having spent one-third of my life as an anaesthetist I fully sympathize with Dr Edwards's difficulties I agree with him that the anaesthetic room and the theatre should be on the same level as the surgical wards and the passage to and from the anaesthetic room should not present any 'terrors' to the patient The two rooms should be close together and should communicate by a partition door The anaesthetic room should look like a miniature ward or a private bedroom or an examination room so that little or no psychic trauma be caused in any patient The transport of the patient should be undertaken by the nurses rather than by porters dressed in theatre clothes

Dr Edwards suggested too that there should be a recovery room adjacent to the theatre and that the patient should remain there until his condition was such that he could be safely taken back to the ward this arrangement allowing both surgeon and anaesthetist to be within easy call in case of emergency, especially when engaged with other operations

Here I beg to differ for I have had experience of such recovery rooms next to the theatre First how many patients could be accommodated in one or two recovery rooms? Secondly, would it not distract both surgeon and anaesthetist from concentrating their attention on the case in hand? Thirdly the recovering patient would in all circumstances disturb the silence that should be observed in and about the operating theatre

I would suggest that the recovery rooms should be in the vicinity of the surgical wards and attended by a special nurse and a medical officer both competent to treat immediate post operative and post anaesthetic conditions With each patient returning from the theatre there should be a report of the operation performed complications found and condition during operation and anaesthesia Also suggestions for further treatment and observations might be made In any emergency or difficulty the attending officer should be in touch with the operating surgeon for further instructions—I am etc,

London W 1 Dec 18th 1936 F N TARAPORVALA

Cervical Gland Tuberculosis

SIR—Judging from some of the letters and especially one in the recent correspondence in the *Journal* with regard to cervical gland tuberculosis it would appear that there still exist those who would advocate the so called radical surgical procedure which one hoped had been dead and buried many years ago

It is I think, fairly obvious when we consider the pathology of the condition and have any clinical experience, that a wise combination of surgical procedure and ultra violet ray therapy is the course of election with perhaps the addition of tuberculin injections in selected cases

The surgical intervention should be limited to the removal of the involved gland or glands and abscess cavity if there be one with primary suture if possible and if not only allowing for a very small drainage aperture Such an operation should be followed by ultra-violet irradiation both local and general the latter being of the utmost importance

Treatment carried out on these lines will in the great majority of cases result in a scarless or practically scarless site of operation no return of the infection and general good health—I am etc,

Bath Dec 18th 1936 H NORMAN BARNETT

Physical Medicine

SIR—Dr A Gordon Watson suggests in his letter in the *Journal* of December 19th 1936 (p 1288) that the Medical Advisory Committee of the British Health Resorts Association *should press for a chair* of physical medicine at all teaching centres Well we tried it on London University as the body which has often been most enterprising in regard to new developments in medical teaching We took up informally with the University the project of a chair in medical hydrology and climatology at the point where it had been left in 1914 when a very distinguished body of medical men including Osler Allbutt Mott and many others, made a proposal to this effect backed by a reasoned statement We returned to the charge in 1935 and drew up a document showing that this is the only country of any importance which offers

no special training in these subjects, and one of the few which offers no diploma after post-graduate instruction We were told that there is no evidence of any demand in this country for such instruction, and therefore no justification for a chair or even a lectureship

We are not convinced, and we intend to use every opportunity that offers for demonstrating our belief that the subject of physical medicine (of which climatology and hydrology are an important section) is worthy of the attention of our medical education authorities—I am, etc,

ALFRED COX,
General Secretary

British Health Resorts Association Ltd,
London, W 1, Dec 21st, 1936

Milton's Blindness

SIR,—I was much interested in the article by "L R" under "Nova et Vetera" in the *Journal* of December 19th, 1936, on the subject of Milton s blindness, and in his reference to my opinion as to its cause

Milton's work, the intriguing incongruities of his changing temperament, the cause and the effects of his tragic blindness are of perennial interest At this distance of time it is of course impossible to be absolutely positive or dogmatic as to the exact pathological nature of his blindness Only an examination by a modern ophthalmologist, with all his modern armamentarium and his present-day precision of diagnosis, could settle the question Even then I expect someone would ask for a second opinion In those days, before ophthalmoscopes for instance, even a lengthy report by a contemporary doctor of Milton's could not seek to define a diagnosis, at least not a diagnosis as we understand the term The diagnosis given then was just amaurosis or gutta serena, some were satisfied merely to say it was a punishment from heaven

All we can now do is to collect all extant references to the symptoms and signs of Milton s blindness, then to tabulate all *the possible* pathological explanations, and finally from among all these possibles carefully to determine the one which is *the most probable* diagnosis The most probable diagnosis on all the evidence about Milton s blindness is, I think, primary chronic glaucoma "L R" suggests an intracranial tumour—namely, a cyst arising from remnants of Rathke s pouch and exerting pressure on the optic chiasma This could certainly cause some of the clinical features of Milton s case, but there were several important, indeed cardinal, symptoms which it would not explain, including the rainbow halo, the sharp pains, and the poet's health during the subsequent twenty-two years of his life

It is not possible to discuss here the various clinical manifestations I have endeavoured to set them all out in my recent book *Hero-Dust* May I, however, remark here that in coming to a diagnosis in circumstances like these an important consideration in one s deliberations should be the fact that a cyst arising from the remnants of Rathke s pouch is a rare thing compared with glaucoma So that of all the possible alternatives in the differential diagnosis which have been suggested both before and since the publication of my book I still feel that I have as yet no reason for altering the final conclusion to which I then came—that the most probable explanation of the cause of Milton s blindness as judged upon all the evidence available is primary chronic glaucoma—I am etc,

London W 1 Dec 21st 1936 JAMES KEMBLE, F R C S

The Consistency of University Examinations

SIR,—The very interesting article by Dr W Gilbert Millar published in your columns on December 12th, 1936, appears at a time when there is considerable disquietude among educationists and others in regard to the value of examinations The analysis of the Edinburgh results that he has made is a valuable contribution to the growing literature on the subject of examinations in general, and is noteworthy as a pioneer effort to assess the reliability of certain medical examinations in particular

The results of his investigation into the correlation existing in the marks recorded in certain medical subjects lead him to suppose that these medical examinations, in contradistinction to those others investigated by the International Examination Inquiry Board, "do give a pretty fair estimate of a student s capabilities, and that such anomalies as are disclosed by Hartog and Rhodes do not occur, or, if they do, only to such an extent as to be negligible" But are there any real grounds for so sanguine a conclusion? It would be very surprising indeed if medical examiners alone had evolved a test technique enabling them to reach a position where serious anomalies did not occur It is difficult to see, for example, why the results in such examinations as Dr Millar quotes should, in the nature of things, be any more reliable in a statistical sense than those, say, of the honours examinations in university mathematics, or the university honours history examinations quoted by Hartog and Rhodes in the publication referred to The evidence adduced does not, I suggest, altogether justify the somewhat sweeping generalizations made in summary form at the conclusion of the article

The coefficients of correlation between the six subjects of the combined third-year examination given in Tables I to VI are calculated on a relatively small number of cases (less than 200) and the value of "r," ranging round about + 0 5, is interpreted as indicating "a very significant correlation of high degree" when taken in conjunction with a P E of about ± 0 04 Dr Millar admits, of course, that the P E in itself does not furnish the best guide to significance in the case of correlations, and quotes it merely as a convenient method of expression He has accordingly checked the results by Fisher s "t" and "z" formulae, but even so, it is surely a bold assumption that an average coefficient of + 0 5 under the conditions of this investigation indicates a high degree of correspondence in the results Hartog and Rhodes, for example, referring to the correlation coefficients between the orders of the different examiners for the papers in the history honours examination, most of them of the order "r" = + 0 5 (see "The Marks of Examiners," p 341), take it for granted that they "may justifiably say that this is a collection of *low* correlation coefficients" There is obviously room, therefore, for disagreement, not so much on the score of the significance of "r" as on the value to be attached to that significance

It is to be noted also that Dr Millar's results, while showing a certain uniformity of performance among the candidates, do not necessarily reveal reliability—namely, the degree of agreement between independent sets of measurements of the same set of things For this purpose it is essential to compare the marks of the various examiners, noting differences in standard deviation random variation, and the like discrepancies As no direct evidence of this kind is produced it is a little unfortunate that the word "consistency" should be used in the title of the article, for the term "consistency" is now being regarded as the more suitable technical substitute for the

After Influenza Pneumonia and other Acute Infections

The general action of 'Bynin' Amara is manifested by increased tone of the nervous, muscular and cardio-vascular systems It stimulates the digestive organs, improves the flagging appetite, corrects anæmia and aids nutrition generally

The marked asthenia and nervous depression which are prominent features of the post-influenzal state, yield rapidly to its influence A course whenever there is any indication of lowered resistance is a valuable safeguard against infection

should like to examine this drift of our thoughts and practice relative to the part played by the skin in the uraemic state

Maintenance of the Water Balance

The body is provided with four channels of elimination the kidneys, the bowel, the lungs and the skin Reflection will show that of these the skin at least has no true excretory function at all, the elimination of water by this channel being really subservient to the necessary provision of a means for cooling the body The normal water balance of the body ranges about an income of 2½ litres per diem Of this 1½ litres are excreted by the kidneys, 1/2 litre, in the proportion of 4/5 and 1/5, by the lungs and the intestine the remaining 1/2 litre being earmarked, as it were, for the use of the skin If, under identical conditions of work and temperature extra water is taken in the excess is got rid of by the kidneys The normal kidney is able to maintain a substantial increase in water elimination for a long time, but if, by feeding with water that capacity is worked up to its maximum possible renal failure will set in At this moment we are all eliminating water by our skin at a rate corresponding to half a litre in twenty-four hours Although this is called insensible perspiration it does not denote any activity on the part of our sweat glands, it is not a slow sweating, but a process of osmosis and evaporation If, however, the temperature of this room were to be raised our rate of water elimination would gradually increase to a point when we would begin to show visible perspiration the secretion of sweat having been shown to begin in health when the body temperature reaches a height of 0·2 to 0·5° C above normal (Kuno 1930) Normal sweat has a specific gravity of 1003, it is the most dilute of all the body fluids In other words the sweat glands are designed to respond to any need of the body for increased evaporation and not to nitrogenous surfeit Even in the absence of visible perspiration we recognize that some skins are dry and some moist without subjecting our observations to precise measurement Our hands not our eyes, tell us that the patient with Graves's disease has a moist skin, and that he with uraemia is dry, even though his subcutaneous tissues may be literally a bog

The Skin in the Uraemic State

In the later stages of sclerosis of the kidney the amount of real kidney tissue available for the bodily needs is but a fraction of the normal The resulting failure is in part qualitative and in part quantitative In the first place the kidney is unable to concentrate urea in order therefore to excrete urea it has to exercise its faculty for excreting water to its utmost ability But this, as I have said, is a limited faculty even in a healthy kidney, how much more restricted, then, in contracted kidney? So the unequal battle goes on, large amounts of water may be eliminated for a time, with ever increasing difficulty until the kidney is on the point of complete arrest At this stage the lungs may excrete a watery sputum, the large bowel initiate a diarrhoea, but the skin remains inert It seems as though the water were more urgently held elsewhere, either in the maintenance of osmotic balance or in excretory channels whereby it may relieve the body of nitrogenous waste This is a condition in which the body can not afford to sweat, for if is essential that any water leaving the tissues should carry with it its quantum of waste At its best the skin is still parsimonious in its output of solids even though it be profligate in expenditure of water We know that it is often difficult to induce sweating in uraemia but that, having seen it established, we ascribe the patient's ultimate recovery to our success My own impression is that when the patient is ready to sweat—that is, when the abnormal claim of other tissues on the water stores of the body having in some way abated, water is again available for the skin—then, and only then, he will sweat The dry skin of uraemia only eliminates water when it is no longer dry If, then your patient is showing evidence of elimination by the lungs or bowel do all you can to aid the action of these organs and leave the skin alone Keep him reasonably warm, watch for the first appearance of moisture on the skin, and then, if you will, apply your packs and your poultices If there is no sign of tentative excretion by any of the accessory channels your patient will die, he is probably the subject of a widespread poisoning the nature of which we do not yet know There are two types of acute uraemia in one the kidney has failed for the time being but the subsidiary paths of elimination are capable of tiding over the crisis while the kidney undergoes a measure of recovery in the other the poison is so far flung that nothing we can do is of the least avail

Conclusion

I have covered a bare tithe of the ground of uraemia, a fraction of chronic Bright's disease We are tempted to ask if this patient with convulsions or coma, this one with nocturnal asthma, and this man with an obstinate dyspepsia are subjects of one and the same disease Yet we recall other conditions which alike in their origin are as far apart as the poles in their appearances Two men are suffering from parenchymatous syphilis of the central nervous system One a paretic, comes to you wearing maybe, the cloak of a Pan European dictator, maybe the motley of a genial clown the tabetic retains his intellectual poise to the last Look back for a moment at some time in our childhood we were interested in the bewildering succession of patterns we saw in a kaleidoscope Yet each little coloured component preserved its own shape through all these variations and the plaything of a forgotten afternoon may have its counterpart in some of these fascinating problems of to day

TREATMENT OF ASPIRIN POISONING BY INTRAVENOUS SODIUM LACTATE SOLUTION

BY

STANLEY W. WILLIAMS, M.D

Medical Superintendent Children's Hospital Melbourne

AND

RONA M PANTING, M.B., B.S.

Resident Medical Officer Children's Hospital, Melbourne

Aspirin, or acetyl salicylic acid, is formed by the action of acetic anhydride upon salicylic acid It is not a completely stable substance, and samples often have the odour of acetic acid In the commercial preparation certain impurities may be present in the form of orthocreosotic acid and acetic acid, as well as free salicylic acid

A solution of aspirin yields a buff-coloured precipitate with ferric chloride In the presence of free salicylic acid a violet colour is formed, although the colour due to a small amount of salicylic acid can be masked by the addition of tartaric, citric, or other oxyacids The limit of free salicylic acid has been suggested as 0 2 per cent in the tablet form (Martindale and Westcott, Vol 2)

Large single doses are usually required to produce symptoms of intoxication, and very large doses may be fatal A patient recently reported by A V Neale (1936) recovered with intensive treatment after taking 500 grains (32 4 grammes) and a patient of S C Dyke's recovered with treatment after taking 435 grains (28 8 grammes) (Dyke, 1935) Dyke also quotes from the literature a series of fatal cases Hitche's patient, who died after taking 1 000 grains (64 8 grammes), five cases of Janoviche's, in whom the average fatal dose had been about 500 grains (32 4 grammes) and a series of cases studied by Balazs, who considered the minimum fatal dose to be in the neighbourhood of 450 to 600 grains (29 8 to 38 9 grammes)

We have found no mention, however, of the dose which may prove fatal in children One child whose case we are here reporting was 14 months old, and took a dose of about 30 grains (1 944 grammes) which would probably have proved fatal but for intensive treatment

Poisoning may also occur where salicylate is administered therapeutically in divided doses M Odin (1932) reports fourteen cases in which poisoning occurred after doses of 90 grains (5 8 grammes) a day and two cases in which only 45 grains (2 9 grammes) per day were administered

Metabolism of Aspirin

The solubility of aspirin in water is very slight—only 1 in 400 —and the rate of hydrolysis is minimum in a neutral solution It is markedly increased by the presence of acid or alkali Martindale showed that the percentage hydrolysis in water after four hours was only 2 9 per cent, in 0 2 per cent hydrochloric acid it was 4 7 per cent Thus hydrolysis with physiological acid is very slight, which means that the amount split up while passing through the stomach does not exceed 5 per cent of the total amount taken The bulk of the ingested aspirin is decomposed by the alkaline intestinal juices to salicylate while a small amount is absorbed unchanged as aspirin and may be excreted in this form The total excretion in the urine of ingested salicylate is normally between 60 and 75 per cent The total excretion of unchanged aspirin varied from 8 to 36 per cent in a series investigated by Henzlik (Martindale and Westcott Vol 2)

Potassium citrate increases the water solubility of the aspirin two volumes of potassium citrate rendering it soluble 1 in 20 (Martindale and Westcott, Vol 1) When prescribed with potassium citrate "there may be a notable difference in physiological effect, as apart from the independent action of the potassium citrate the speed and even the locus of absorption in the system, may give enhanced effect A larger proportion may perhaps be absorbed in the stomach, and in consequence less would be carried forward to the duodenum, where alone aspirin is thought to be assimilated" Sodium bicarbonate has a similar action in hastening the decomposition of aspirin and leads to the formation of acetate and salicylate of sodium These pharmacological factors have an important bearing on the treatment of aspirin poisoning For example, a stomach wash-out will probably be of value only if performed within the first hour or two after the ingestion of the aspirin, when the bulk of the aspirin has not yet passed on to the duodenum Also, the oral administration of sodium bicarbonate as an antidote, which is so popularly favoured, is contraindicated in the early stage when the absorption of aspirin may be increased

Clinical Picture

The clinical features of aspirin poisoning may best be described by the report of a case from the literature S C Dyke's patient (1935) was a woman who recovered after taking 435 grains (28 8 grammes) In the first few hours of illness the main symptoms were nausea and buzzing in the ears During the night she appeared to be mentally confused, and became deaf Next day she became stuporous, disorientated, and extremely restless, and resisted all interference Severe vomiting produced dehydration, but sweating was not specially noted Her respirations were deep and slow, and she presented the picture of acidosis, the urine showing acetone by Rothera's test and a deep purple colour with ferric chloride This latter reaction was out of proportion to the amount of acetone present, and was best explained by the probable presence of aspirin in the urine Visceral damage was indicated by the presence in the urine of bile salts and traces of urobilin The urine also reduced Fehling's solution Treatment consisted mainly in the administration of fluid and glucose by the bowel and mouth, and in repeated lumbar punctures, which appeared to have a very beneficial effect By the third day the patient had improved, although she was still drowsy and complained that her head felt large and that her vision was blurred She made a complete recovery

A V Neale (1936) described a patient who rapidly developed symptoms after taking 500 grains (32 4 grammes) of aspirin Vomiting occurred after two and a half hours, and four and a half hours later she became semi-comatose She was very pale and sweated profusely, and her respirations were quick and shallow, later becoming deeper The alkali reserve in this patient was 40 volumes per cent (the normal is from 50 to 60 volumes per cent) Treatment consisted chiefly of a stomach wash-out and lumbar puncture In twenty four hours there was improvement, but she complained of deafness and tinnitus A reactionary pyrexia up to 100° F (38° C) followed forty-eight hours later The urine was free from salicylic acid four days after admission

Report of Patients at the Children's Hospital, Melbourne

CASE I

A male infant 14 months old was admitted to the Children's Hospital Melbourne under the care of Dr Stewart Ferguson at 4 p.m. on September 16 1936, with the history that two and a half hours previously he had eaten six o

PROTAMINE INSULIN AND ZINC PROTAMINE INSULIN IN THE TREATMENT OF DIABETES MELLITUS*

BY

H P HIMSWORTH, M D , M R C P

Deputy Director of the Medical Unit and in Charge of its Diabetic Clinic University College Hospital London

It is now nearly sixteen years since insulin was discovered and in this period the treatment of diabetes mellitus has been changed profoundly The first stage of this period was occupied in learning how to adopt the use of insulin to that dietetic treatment which had been devised to eke out the diabetic's existence before the introduction of insulin The second stage saw a less theoretical outlook develop when, as a result of the empirical trial of high carbohydrate diets, physicians were emboldened to adjust insulin to the patient's requirements when taking a more natural diet The last two years have seen us enter a third stage—the stage in which insulin itself is being artificially modified to meet more effectively the requirements of the diabetic patient

As yet the protamine insulin preparations have not been widely used in this country, and this is largely due to the commendable caution of the various manufacturers of insulin who refrained from putting on the market, without adequate investigation modifications of such a vital agent But very shortly now these new preparations will be available for general use and, judging by past history in therapeutics, it is possible that their general acceptance will be inaugurated by a period of considerable disagreement as to their value Such a period may be inevitable, but it is to be hoped that it will not delay a just appreciation of the new remedies nor vest them with pretensions which have later to be discarded The risk of either of these unfortunate possibilities can be minimized if at this time we take the trouble to review the present state of diabetic therapeutics with the object of placing ourselves in a position to decide exactly what improvement in treatment we may expect from the new preparations

To do this we must begin by considering clearly two questions What is the object of our treatment of the individual diabetic patient? How far towards this aim does the treatment available to day carry us? Then from what is already known of the new preparations, we may try to see how much nearer they can bring us to the attainment of this same object

The Object of Treatment

At the risk of being trite I shall define the aim of treatment in our individual diabetic patient as the production of a normal sense of physical health and mental well being The significance of this definition will become more apparent when it is insisted that no chemical definition of normality such as freedom from glycosuria or a blood sugar value within normal levels can justifiably be taken in substitution In medicine the ultimate achievement must be measured by clinical not by chemical standards The diabetic without complications has nowadays the right to feel well, and if he does not do so then treatment is at fault But patients with their differing temperaments, have different measures of well being and it is necessary that we as clinicians should have some standard by which the vague generalizations of several individuals can be assessed in relatively precise terms I suggest that a diabetic may be considered to have achieved satisfactory physical and mental health when he has satisfied the following three standards He must have sufficient energy for his needs he must maintain his weight about the accepted normal figure for his height and age, and he must not be subject to hypoglycaemic symptoms Each of these standards is worthy of further consideration

For a diabetic to feel that he has at his disposal sufficient energy to take again his place in the world with healthy men and women the physician must have dealt successfully with two problems He must have controlled the physical disability arising from the disease and he must have sustained the patient to overcome the psychological shock consequent upon the realization that he has diabetes The latter feat presents varying degrees of difficulty, but the persistence in the lay mind of prognostic standards derived from medical experience before insulin was available still engenders a real psychological factor in each case There is no weapon so potent against this as the knowledge on the part of the physician that diabetes mellitus, in all save the severest cases can now be so effectively controlled that the conscientious patient need suffer no disability from his disease and I would urge the importance of imparting to the patient this conviction and the knowledge of the experience upon which it is based

In a disease which is characterized by deficient assimilation of certain foodstuffs a knowledge of the variations in the patient's weight provides us with a valuable index of the general effect of our treatment (Himsworth 1936) When the wasteful excretion of food as glycosuria has been either abolished or restricted a falling of the weight below the normal standard clearly indicates that the diet is unsatisfactory But an increase in the weight to an abnormal figure is also unsatisfactory for such gains presage a breakdown in carbohydrate tolerance A weight at the normal figure for the patient's age and height should be established and preserved

It is unfortunate but it is necessary that the absence of symptoms from overdosage with insulin must be included as one of the standards of the successful treatment of diabetes It is undeniable that nowadays many diabetics, especially children lead lives restricted by the

* Lecture delivered to the Harrogate Division of the British Medical Association on March 5

seven aspirin tablets—that is at least 30 grains (1 944 grammes) Half an hour later he had vomited white frothy material freely mixed with pink blood and the vomiting had been repeated three or four times He was now looking a little paler than normal but was otherwise well At 6 p m he had a temperature of 98 5 F (36 8 C) a good pulse of 128 and the respirations of 28 per minute were quiet and easy When seen again at 11 p m he was sitting up and looking very wideawake but seemed quite comfortable with a good pulse and colour During the night his respirations increased in frequency and depth, and he became agitated and noisy passing a sleepless night Five ounces (142 1 c cm) of 10 per cent glucose and saline were taken orally by the child When seen next morning he showed extreme mental and physical restlessness and great thirst He drank liberal amounts of fluid but most of it was vomited His respirations were rapid and gasping at 56 per minute Circulatory depression was present the pulse being 162 per minute and of very poor volume and the child's colour was slightly grey and cyanotic He was also dehydrated and hollow eyed A specimen of blood was taken from the superior longitudinal sinus through the anterior fontanelle for an estimation of the alkali reserve which was 22 volumes per cent The temperature was 102 F (39° C) His general condition rapidly became worse and the respiratory distress was greater, making the outlook extremely grave

A continuous intravenous infusion of a buffer solution of isotonic sodium lactate as described by Hartmann (1934) was commenced and 15 ounces (85 6 c cm) were run in by the slow drip method This was followed by 30 ounces (170 52 c cm) of 10 per cent glucose and saline solution Two units of insulin were given four hourly with the glucose Chloral hydrate and potassium bromide 4 grains were administered as a sedative and large amounts of sodium bicarbonate solution and glucose were given by mouth

Two hours after the intravenous solution had been running his general condition commenced to improve His colour and circulation were better and the respirations though deep and rapid were less distressed His temperature remained elevated and he fell into a light restless sleep By the next morning he had become peaceful and the respirations while remaining rapid were shallow and easy Another estimation of the alkali reserve showed that it had risen to 55 volumes per cent On the following day the alkali reserve had fallen again to 38 volumes per cent but the general improvement was sufficiently established to allow the intravenous infusion to be discontinued

From the third day until the tenth day he continued to vomit several times daily he was looking pale and sick running an irregular temperature and losing weight The urine showed occasional hyaline and granular casts The alkali reserve on the seventh day was 42 volumes per cent From the tenth day onwards he commenced to improve and to gain in weight and became a normal cheerful baby once more making a complete recovery

There are many interesting features in this case on which we should like to comment There are several symptoms in common with those seen in adult patients, such as the vomiting mental restlessness, thirst dehydration, and respiratory changes The long latent period may be very misleading in assessing the seriousness of the intoxication There is also the very critical level of 22 volumes per cent to which the alkali reserve had fallen this is the lowest figure we have seen reported in literature in which recovery occurred

With regard to treatment it would have been advisable to wash out the stomach in spite of the fact that copious vomiting had occurred The dose of sodium lactate solution required to raise the alkali reserve 25 to 30 volumes per cent is 10 c cm of the molar sodium lactate per kilogramme of body weight diluted with five volumes of distilled water (Williams and Panting) We can find no previous record of the treatment of aspirin poisoning with this solution

Discussion

It is of interest to consider what is the pathological and biochemical basis underlying these clinical manifestations of profound toxaemia in aspirin poisoning A necropsy of the case described by Andrew Wyllie (1935) revealed blood in the stomach and petechial haemorrhages on the serous surfaces of the lungs and heart The kidneys were in a condition of glomerulonephritis, and the liver showed fatty degeneration Paisseau, Friedmann, and Vaille (1934) describe the anatomical changes as being discrete in the case of the kidneys, but of great intensity in the liver which was in a state of fatty degeneration The anatomical changes are well established, but the mechanism of the production of the clinical syndrome is not so universally agreed upon

Almost everywhere in the literature salicylate poisoning has been regarded as an acidosis due to poisoning by the acid radical, either that contained in the salicylate itself, the view most commonly held or by some other acid formed in the body as a result of disturbed metabolism, a view held by Balazs (1930) In 1928 opposition had been raised by Veil and Graubner against the view that salicylate poisoning was due to an acidosis and more recently by Martin Odin, who regards the symptoms of deep respiration as being due to a specific toxic action of the salicylate on the respiratory centre

As early as 1882 Quincke described the hyperpnoea so frequently found in salicylate poisoning and regarded it as being due to the action of the acid radical on the respiratory centre This was again regarded as being analogous to the deep breathing found regularly in the acidosis of diabetic coma Further support for this conception is the fact that there is always a fall in the alkali reserve of the blood Also it is thought that a favourable result could be observed from the administration of sodium bicarbonate G Paisseau notes further points in favour of this interpretation in the acidity of the urine with a constantly lowered *p*H, the resistance to alkalinization, and the raised ammonia excretion

Veil and Graubner base their opposing theory partly on certain theoretical calculations showing disproportion between the fall of the alkali reserve and the quantity of salicylic acid ingested They regard the deep breathing as due to a specific action on the respiratory centre

Martin Odin (1932) compares the biochemical findings in salicylic intoxication and diabetic coma He finds in the first instance an average alkali reserve of 38 volumes, a salicylic acid content of the blood of about 0 3 gramme per litre of blood, the *p*H of the blood being normal or slightly raised In diabetic coma where deep breathing was present the alkali reserve was usually about 26 volumes, the total acids in the blood 0 75 gramme per litre—double the amount of salicylic acid—and the *p*H of the blood lowered He draws the conclusion that the salicylic acid must be considerably more toxic than diacetic acid, seeing that the symptoms of poisoning in diabetic coma arise only when the content of the latter acid in the blood is considerably higher And so one can hardly speak of salicylic poisoning as an acid poisoning pure and simple it is a more specific toxic action

Investigation of a second child treated at the Children's Hospital, Melbourne, for aspirin poisoning lends support to the view of a specific action of salicylate on the respiratory centre, at least in the earlier stage of the toxic effect

CASE II

A girl aged 2 years and 8 months swallowed approximately 60 grains (3 89 grammes) of aspirin and it was not until twelve hours later that her parents became worried

fear that symptoms of hypoglycaemia may supervene if they depart from a routine of semi-invalidism This state of affairs results directly from the imposition on clinical medicine of chemical standards of normality to the disregard of clinical evidence If chemical signs such as freedom from glycosuria or the restriction of variations in the blood sugar level within certain limits are elevated to the status of objects of treatment, then on the finding of glycosuria, or an unusual hyperglycaemia, treatment must logically be devoted to its removal, even if this involves the periodic induction of hypoglycaemic attacks It should be realized once and for all that, with the treatment at present available, there are many diabetics whose blood sugar cannot be maintained within normal limits, whose urine can never be kept consistently free of sugar, without giving insulin in such doses that frequent hypoglycaemic attacks will certainly result and prevent the patient attaining a stable and normal degree of health To satisfy chemical criteria at the price of such disability from over-treatment is the antithesis of rational therapeutics

First Stage of Treatment

Hitherto we have been dealing with that final phase of treatment which is concerned with the adjusting of the diabetic to normal health, but we must now consider the preliminary phase in which the patient is being removed from the dangers of the uncontrolled disease itself In this stage we are dealing with the gross objective evidence of disordered metabolism, and the finer subjective appreciations of health are submerged in the general illness of the patient It is here that chemistry finds its proper place as a guide to treatment

To-day there are in use three main tests estimation of the blood sugar, testing of the urine for sugar, and testing of the urine for ketone bodies Of the information these provide a knowledge of the presence or absence of ketonuria is immeasurably the most important (Himsworth, 1934a, 1936) Ketonuria indicates that the morbid processes of diabetic metabolism hold sway within the body and until they are under control, as indicated by the cessation of ketonuria, the diabetic is in danger of being overcome by his disease in its crudest form and dying in diabetic coma We have two simple tests available for detection of ketone bodies in the urine The ferric chloride test, which detects these substances only when they are present in quantities which indicate the imminence of coma, and the nitroprusside test, which detects them in minute amounts such as occur in the early stages of balancing and in the severe relapses of the previously balanced patient Patients in whom the ferric chloride test is positive are medical emergencies and should be treated as such (Himsworth, 1932), patients in whom the ferric chloride reaction is negative but the nitroprusside reaction is positive are in no immediate danger, but are as yet still the subject of grossly disordered metabolism A more detailed discussion of the significance of these tests and the treatment of the states they reveal is out of place here and has already been given in detail elsewhere (Himsworth, 1932, 1936)

It is regrettable that a knowledge of the blood sugar level should still enjoy the greatest vogue as the guide to treatment Based on imposing theoretical considerations it yet survives the practical criticism that it bears little relation to the condition of the patient (Himsworth, 1934a) In my opinion its use is comparable to that of the electrocardiogram Both are useful in research and in diagnosis, both are superfluous as guides to treatment

Testing the urine for sugar has lost prestige as a result of the authoritative support accorded to the blood-sugar test This is unfortunate, as the urine can be made to yield relatively more information than the blood The finding of glycosuria indicates loss of food in the urine, the testing of specimens passed at different times in the day shows when this waste occurs and points the way to the necessary modification in treatment If Benedict's test is used the resulting colour measures the concentration of sugar in the urine, and if a sequence of urine specimens are examined the rise and fall of the sugar level in the body is revealed (Fig 1) Such knowledge permits a much closer control of treatment than do isolated blood sugar estimations (Himsworth, 1936)

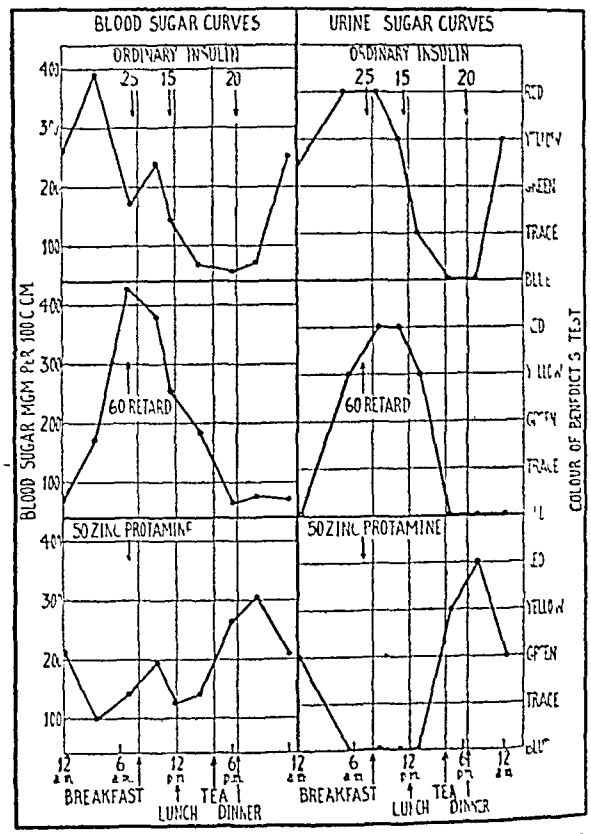

FIG 1.—Blood sugar and urine sugar curves showing the effects of ordinary insulin, insulin retard, and zinc protamine insulin taken from the same patient while on the same diet (Case III) The urine sugar test is performed by adding eight drops of urine to one teaspoonful of Benedict's solution and boiling briskly for fifteen seconds After standing for two or three minutes the colour of the test is noted Red, yellow, and green precipitates and a greenish opalescence (trace) indicate respectively decreasing concentrations of urinary sugar

We can conclude that the metabolism of a diabetic patient may be considered under control when the urine is always free of acetone bodies and when the waste of glycosuria has been reduced to the minimum compatible with freedom from hypoglycaemic attacks This control and the attainment of the ultimate objects of treatment can be achieved by the appropriate use of diet and insulin

Diet

For a considerable time after the discovery of insulin diets greatly restricted in carbohydrate continued to be employed, but the successful trial of higher carbohydrate diets has now resulted in the acceptance of a regime which approximates to that of healthy individuals The discovery of insulin automatically rendered obsolete the various formulae which were taught for calculating the amount and composition of the diabetic's food intake,

about her condition At first irritable, while mentally very alert with rapid breathing and fits of screaming she was admitted to hospital twenty four hours after the ingestion of the aspirin Her clinical picture, with deep rapid respirations 48 per minute, flushed face, and vomiting, was compatible with a diagnosis of acidosis, yet this was not confirmed by investigation The alkali reserve was 50 volumes per cent, and the urine gave negative reactions to Gerhardt's and Rothera's tests The treatment given was 8 ounces (227 c cm) of 2 per cent glucose and saline solution intravenously, and 1 pint (568 c cm) of 10 per cent glucose and 0 9 per cent sodium bicarbonate solution orally during the first twelve hours The child's breathing remained deep, and the rate was 40 per minute, she was still irritable The alkali reserve had fallen to 29 volumes per cent and the urine gave positive reactions to Gerhardt's and Rothera's tests, showing that a state of acidosis had developed

Twenty six ounces (738 c cm) of sodium lactate solution and 17 ounces (447 c cm) of 10 per cent glucose and saline solution were given by the slow-drip method intravenously in twenty hours the patient showing considerable improvement She was able to take a normal light diet and appeared quite well after a further three days

Conclusion

In our cases the weight of evidence seems to be in favour of the intoxication being possibly a toxic action on the respiratory centre, but chiefly due to an acidosis This is borne out by the rapid improvement in the clinical condition which accompanied the rise in the alkali reserve following the administration of sodium lactate solution Odin (1932) warns us to be careful in using salicylate in nephritic patients In two of his cases already quoted albumin was present in the urine before treatment was commenced, and both patients developed symptoms of poisoning with so small a dose as 45 grains a day All of his cases had a moderate number of red blood cells in the urine, five had albuminuria, and two had some casts This, considered with the necropsy findings of acute nephritis, indicates that it is difficult for nephritic patients to excrete salicylic acid

Summary

1 A survey of the reported cases of aspirin poisoning is given, showing that large doses are necessary in adults to produce toxic effects

2 Alkalis increase the absorbability of aspirin

3 Two infants, who developed severe toxic symptoms after the ingestion of 30 grains (1 944 grammes) and 60 grains (3 89 grammes) of aspirin respectively are described both recovered after sodium lactate (Hartmann's solution) had been injected intravenously

4 It is considered that the toxicity of aspirin is due to an acidosis, and possibly to a direct action of salicylic acid on the respiratory centre

ACKNOWLEDGEMENTS

We wish to thank Dr Stewart Ferguson for permission to publish the reports of these patients

We are greatly indebted to Miss Splatt of the Walter and Eliza Hall Institute Melbourne, whose estimations of the alkali reserve served as a valuable guide to treatment, to Dr Bolton medical superintendent of the Royal Melbourne Hospital who supplied us with the sodium lactate solution, and to Dr Ian Wood for his advice and assistance

CONTINUOUS INTRAVENOUS SALINE INFUSION

BY

HAMILTON BAILEY, F.R.C.S
Surgeon Royal Northern Hospital

WILFRED I. B. STRINGER, M.D., M.C.P.S.
Resident Medical Officer, Royal Northern Hospital

AND

KENNETH D. KERR, M.D., M.R.C.P.
Casualty Physician St Bartholomew's Hospital
Late Medical Registrar Royal Northern Hospital

Continuous intravenous saline infusion is now being used more extensively in this country unquestionably it has helped to save many lives We feel that a time has been reached when it would be well to review its advantages, to try to enumerate its indications and contraindications, and particularly to dwell upon the dangers connected with its use

Indications

1 *Dehydration* from any cause such as starvation, vomiting diarrhoea or excessive sweating—In acute intestinal obstruction the combination of continuous gastric aspiration and continuous intravenous saline infusion both before and after operation is a marvellous therapeutic advance

2 *Prevention of Post operative Shock*—A typical indication is at the close of the operation of partial gastrectomy especially when it has been performed on a poor subject

3 *Shock*—Here we appear to have a helpful method of combating shock In these cases we have added one ampoule of coramine to each pint of saline solution with advantage French observers have reported favourably on the results of adding adrenaline to the solution in doses of about 5 minims of 1 in 1,000 solution to each pint

4 *Diabetic Coma*—This is probably the best method of introducing large quantities of glucose and insulin, a measure which is so necessary in this condition

5 *Post-operative Thyrotoxicosis*—It has long been recognized that a copious fluid intake is beneficial in these cases If administered early enough continuous intravenous saline infusion will often tide the patient over a crisis If hyperpyrexia and other signs indicate that the patient is being flooded with the toxin the injection of 50 minims or more of Lugol's solution into the delivery tube, associated with the application of an ice pack to the limbs and precordial region, and, above all the employment of an oxygen tent, is the best possible course to adopt in these anxious, but now fortunately rare, catastrophes

6 *In profound jaundice after the obstruction has been removed* it is often remarkable how quickly the jaundice clears when continuous intravenous saline treatment is administered (see also Contraindications)

7 *Septicaemia*—That benefit accrues from continuous intravenous medication in septicaemia is not generally agreed In our experience in some cases continuous intravenous saline therapy, by diluting the circulating toxin and stimulating the excretory activity of the kidneys, appears to have done good The addition of a capsule of intravenous mercurochrome to each filling of the reservoir definitely has done no harm and we believe that in several cases of septicaemia it has helped the patient to combat the infection

and the realization of this, combined with the acceptance of the modern diets, has permitted a great simplification of treatment

The calorie value need no longer be calculated, for the amount of food taken by the patient is governed by the weight chart While it is still a practical advantage to begin balancing a diabetic on a diet in which the amount of food is restricted, the final quantity taken by the balanced patient need only be restricted if he is over weight

The composition of the diet now advised varies somewhat, but I think it is permissible to say that in this country medical opinion is rapidly accepting a proportion of the order of carbohydrate 2, protein 1 fat 1, so that a 2000 calorie diet of this type contains about 200 grammes of carbohydrate Those who are familiar with diets containing 50 or 60 grammes of carbohydrate may raise objections to such a large allowance, but their main practical objection can be anticipated and disproved Such large allowances of carbohydrate do not necessitate proportionate increases in insulin dosage Often the dose need not be increased, infrequently a few more units are required (Himsworth, 1934b) The advantages of the new diets are obvious to all who have tried them It is undeniable that they are more convenient and that they are more palatable Comparison of the number of admissions to University College Hospital for rebalancing since these diets were used with those of the period in which a low carbohydrate diet was given suggests that they render the patient less liable to relapse It is probably to the new diets that the disappearance of xanthoma diabeticorum and of diabetic dwarfism can be attributed, while evidence already available encourages the hope that this increased carbohydrate militates against the development of the most fatal complication of diabetes arteriosclerosis (Rabinowitch *et al* 1934, Joslin, 1935, White, 1932) And lastly, but most important they increase the patient's subjective sensations of health and energy These diets have come to stay and will supplant completely their older rivals in the treatment of diabetes

Insulin

Nearly all patients who become diabetic before middle age require insulin within two years of developing the disease, of those in whom the condition appears in later life about one half come to need it The indications for the administration of insulin can be stated precisely It must be given immediately to any patient whose urine contains sufficient acetone to give a positive ferric chloride test, it must be given to a diabetic who, after four days treatment with a modern diet, passes urine which in the majority of specimens contains enough acetone to give a positive nitroprusside test, it must be given to a patient who while showing no ketonuria, passes sugar in all specimens after a fortnight's dietetic treatment

Insulin treatment having begun the dose is systematically increased until the chemical tests indicate that the patient's metabolism is under control and the final objects of treatment are in sight (Himsworth, 1936) We must now consider how far modern dietetics and ordinary insulin will carry us along the path of treatment

Mild diabetes can be treated successfully with diet alone More severe cases require in addition insulin, in one, two, three, or even four doses a day The severest cases cannot be completely controlled throughout the whole twenty-four hours In these latter cases by large and repeated doses during the day the disease can be more or less restrained, but at night, in the absence of further injections of insulin, the abnormal metabolism again reasserts itself For half the twenty four hours such cases are virtually untreated diabetics, and by reason of this are prevented from attaining the normal health which less severe cases can achieve (Fig 1)

This summary of the possibilities of present day treatment reveals that it is to the transience and the rapidity of ordinary insulin action that in the severer cases of diabetes the obvious shortcomings of our therapeutics can be attributed The transient effect necessitates multiple doses for cases of any severity, and makes control of the disease difficult if not impossible during the night The rapidity of action results in the full effect of the insulin injected being manifested within a short time of injection and thus, by rendering a hypoglycaemic attack inevitable if insulin in excess of the immediate requirements is given it precludes either the administration of the multiple daily injections as one dose or the control of the diabetes during the night by a large injection of insulin in the evening It was to meet the needs created by the shortcomings of ordinary insulin that an attempt was made to find a preparation which would have an action at once longer and slower The production by Hagedorn after many years of research of a preparation in which insulin was linked to a natural protamine from fish sperm was the first attempt which was fully successful (Hagedorn *et al* 1936) Modifications of the original discovery have since appeared and the most notable of these is D A Scott's preparation containing zinc, protamine, and insulin (Scott and Fisher, 1936*a*, 1936*b*) To avoid confusion we shall refer to Hagedorn's* preparation protamine insulin by its trade name of insulin retard and to Scott's modification as zinc protamine insulin The work upon which the following conclusions are based has been carried out in conjunction with Dr M R Thomas at University College Hospital

Advantages of Protamine Insulins

The slow action of the protamine insulins is seen only after subcutaneous injection After intravenous injection their action differs little from that of ordinary insulin given by the same route

In different patients either of the new insulin preparations shows slight variation both as regards duration and speed of action, but of the two the zinc protamine insulin acts more slowly For the purposes of comparison we may take conditions under which ordinary insulin exerts its maximum effect in two to three hours after injection and is spent at the end of six hours Insulin retard under such conditions would produce its maximum effect in six to ten hours and have worn off by twelve to eighteen hours Zinc protamine insulin would show its greatest effect in eight to fifteen hours and be still exerting some action at twenty-four to thirty hours (Fig 1)

This comparison indicates the respective advantages and disadvantages of the new preparations and suggests the considerations which must be taken into account when formulating a technique for their administration The prolongation of action obviously allows reduction in the number of doses and ensures that the injection of either preparation in the late afternoon controls the disease throughout the night In the less severe cases, which require one or two daily injections of small amounts of ordinary insulin, the administration of either new preparation in one dose before breakfast will give equally good control In more severe cases the longer action of zinc protamine insulin permits effective control with a single

* I am indebted to Dr Hagedorn of Copenhagen and Messrs Boots Pure Drug Co for their generous supplies of insulin retard and zinc protamine insulin suspensions respectively

8 *As a Convenient Means of Inducing Evipan Anaesthesia*—In cases of perforated peptic ulcer we give the patient continuous intravenous saline infusion while the theatre is being made ready With the saline solution still dripping into the vein the patient is brought to the theatre The abdomen is opened under local anaesthesia As soon as the peritoneum has been reached a small dose of evipan is introduced into the rubber tubing of the saline apparatus, and evipan flows into the vein together with the saline solution which has been turned to a steady flow The anaesthesia produced by the evipan gives ample time for the performance of the operation The infusion before and during the operation mitigates shock, and the absence of a general anaesthetic helps in a large measure, to prevent a major complication of treated perforated peptic ulcer—pulmonary involvement

9 *Continuous Intravenous Sodium Sulphate in Oliguria and Anuria*—Providing that in obstructive cases the cause of the anuria has been removed continuous intravenous saline, or, what would be better still, continuous intravenous sodium sulphate, are diuretics without a peer I L Dick found that in every case the diuresis produced by intravenous sodium sulphate was greater than that produced by sodium chloride and in no case was there any evidence of storage of sodium sulphate in the body An isotonic solution is made by dissolving 42 85 grammes of Glauber's salt in one litre of water We have used this solution in a variety of cases of anuria oliguria, and latent uraemia Needless to say in cases where there is a mechanical obstruction to the outflow of urine this must be first removed Some of the patients were actually moribund In only one instance did it fail to produce diuresis and that was in a case of polycystic disease of the kidneys which at the post mortem examination showed no evidence of any renal tissue remaining We generally give only one or one and a half pints of this solution daily, during the rest of the twenty four hours normal saline solution is employed There is no reason for limiting the dosage to this amount other than timidity on our part

Contraindications

1 *The Failing Heart*—A history of dyspnoea on exertion uncompensated valvular disease, or any possibility of cardiac weakness should call for hesitation in increasing the bulk of circulating fluid When the integrity of the heart muscle is suspected a physician should be consulted before employing continuous intravenous saline infusion

2 *Pulmonary Congestion*—In all conditions where there are signs of oedema or consolidation of the bases of the lungs the method is inadvisable

3 *Hypertension*—If the blood pressure is high it is obviously courting danger to burden the circulation still further Essential hypertension and the sthenic form of uraemia with convulsions are especially mentioned as contraindications, for in these cases some degree of cerebral oedema may be present

4 *Bright's disease* in all its stages is a grave contraindication In advanced uraemia, where Bright's disease is a possible underlying cause venesection one pint followed by continuous intravenous sodium sulphate one to one and a half pints may be tried The same precaution of preliminary venesection and cautious replacement of circulating fluid should be taken in all cases of chronic bilateral pyelonephritis Polycystic disease is a definite contraindication

5 *In Obstructive Jaundice where the Obstruction has not been Removed Completely*—Death is hastened by this measure, as was observed in one of our patients where the obstruction was due to carcinoma of the common hepatic duct At the post mortem examination the kidneys were deeply stained and choked with bile

Preparation of the Solution

Obviously a solution which is introduced directly into the circulation must be absolutely sterile but this is not enough It must also be free from dead bacteria and other extraneous matter such as fur from the sterilizer Boiled tap water does not fulfil these requirements and if it is used reactions are bound to occur Triply distilled water must be employed in all cases Although the Pharmaceutical Society is less stringent in its regulations we have made it a rule that distilled water more than a week old is discarded With a view to this flasks are stamped with the date of preparation

It is, of course, equally important to have the sodium chloride sterile and pure Tablets sold in tubes for the preparation of normal saline are not prepared with a view to intravenous therapy Sterile ampoules for making a 5 per cent solution of glucose are readily obtainable it would be an advantage to have similar ampoules of sodium chloride

In fully equipped institutions the whole of the work of preparing the saline solution can be undertaken by the dispensary staff At the Royal Northern Hospital flasks of sterile saline solution prepared by the dispenser with newly triply distilled water are supplied on demand to the wards Periodical bacterial examinations are made in the pathological laboratory

Saline or Saline and Glucose?—Normal saline solution alone meets most requirements It has two outstanding advantages over glucose or combined saline and glucose First, it causes less chemical phlebitis and thrombosis, and secondly it is manifestly physiological When glucose is employed we are introducing a substance into the circulation which requires katabolism and in our opinion if glucose is to be used there should be adequate reasons for its introduction the patient must be in need of glucose, as one who has been starved and only sufficient glucose for his immediate needs should be introduced by the intravenous route A 5 per cent solution of glucose in six pints of saline contains about 180 grammes of glucose so at the usual rate of flow the patient is receiving 720 calories in the twenty four hours This may be increased if no other source of nourishment can be utilized by the patient As regards insulin if there is no reason to think that there is a deficiency in this hormone there is no reason to give more

Technique

Inserting a Needle or Cannula—It is not always necessary to cut down upon a vein, a small nick in the skin and the insertion of a special hollow needle (Fig 1)

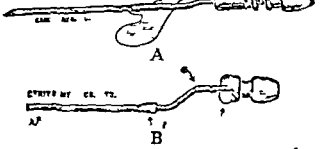

FIG 1—A Needle for inserting into a vein by a puncture Once it is in place satisfactorily it is kept at rest by a strip of adhesive plaster across each flange B Cannula for use when vein is too inconspicuous for a needle to be inserted This is made in two sizes for adults and children

is equally effective in many instances A vein in the forearm is usually chosen It is a great mistake to choose the most prominent vein One which is easily palpable but well obscured and supported by subcutaneous fat will

morning dose when insulin retard, with its relatively shorter action fails to do so (Case III)

The slowness of action by avoiding sudden reduction in the sugar content of the blood minimizes the possibility of hypoglycaemic attacks This has a great practical advantage in relation to exercise Exercise, as is well known,

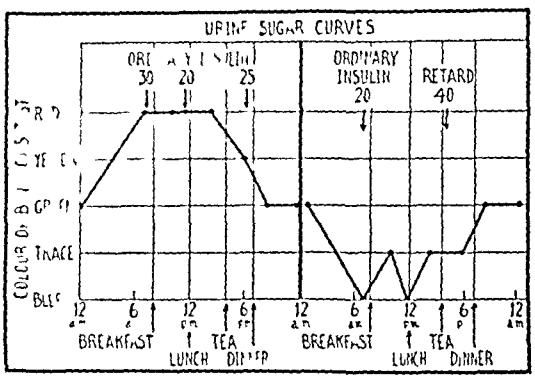

FIG 2—Urine sugar curves from a girl aged 16 years, the first while taking ordinary insulin the second taking ordinary insulin and insulin retard The diet was the same in both instances (Case II)

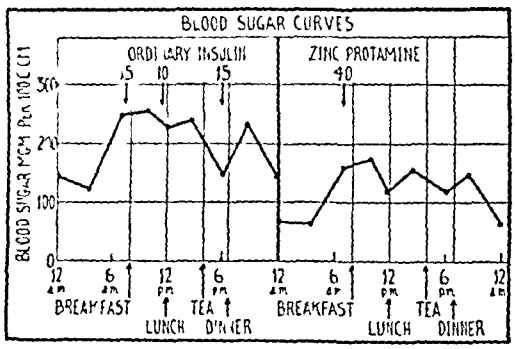

FIG 3—Blood sugar curves from a man aged 65 years, the first while taking ordinary insulin the second taking zinc protamine insulin The diet was the same on both occasions (Case I)

potentiates insulin action, and any diabetic taking ordinary insulin is liable to precipitate a hypoglycaemic attack by unusual exertion These slower-acting preparations are less affected by exercise, and hypoglycaemia from this influence is infrequent

Disadvantages

The very characteristics which constitute the advantages of the protamine insulins also have their drawbacks The first disadvantage they give rise to is the severity and nature of the hypoglycaemic attacks when they do occur As a result of the prolonged action hypoglycaemic attacks when untreated last for a considerable time, and administration of sugar may need to be repeated many times to counteract the series of relapses occasioned by the persisting insulin effect The mild attacks, produced by ordinary insulin and consisting of subjective sensations followed by rapid spontaneous recovery, do not occur, for with protamine insulins the attack once it begins, progresses to severity A further unpleasant feature is the suddenness with which severe attacks burst on the patient The fall of blood sugar produced by the new insulins appears to be so gentle that the warning symptoms of hypoglycaemia are not evoked and the blood sugar slides on unchecked to lower levels where a severe attack is inevitable The danger of such attacks is naturally more with zinc protamine insulin than with insulin retard, as the duration of action of the former for more than twenty four hours favours a summation effect It is because of these severe hypoglycaemic attacks that one cannot fully utilize this summation effect and give indefinitely large single doses of the protamine insulins in an attempt to enable severe cases to manage with one injection a day It may be here noted that, as in the case of ordinary insulin, the susceptibility to hypoglycaemic attacks is most marked in the young and least evident in the old

The second disadvantage is attributable to the slowness with which the protamine insulins come into action This renders them less efficient than ordinary insulin in restraining the rise of sugar in the body and the consequent glycosuria, following the rapid influx of sugar after meals It has long been known that the susceptibility of the body to the action of ordinary insulin varies at different times of the day, being least at breakfast, more marked in the evening, and most marked in the middle of the day Exactly the same variation in susceptibility is revealed by the new insulin It is for this reason that, in cases of any severity, single morning doses of the protamine insulins are so inefficient in restraining the rise of blood sugar and restricting the glycosuria after breakfast, and it is for the same reason that attempts to remedy this particular inefficiency by increasing the size of the single dose, to amounts which will abolish the post-breakfast glycosuria, may result in hypoglycaemia either during the night or in the middle of the morning, when the body is becoming most susceptible to insulin Realization of this point has led to the devising of a technique designed to avoid hypoglycaemia whilst restricting post-absorptive glycosuria within reasonable limits

Technique of Administration

Hagedorn (*et al*, 1936, Krarup, 1935), using the moderately slow-acting insulin retard, does not attempt to treat any save mild cases with one dose of insulin a day In the severer cases he gives insulin retard in the afternoon to control the disease in the evening and during the night, and next morning before breakfast he gives a dose of ordinary insulin This latter by the rapidity of its action controls the glycosuria consequent upon breakfast, and by reason of its transience does not continue acting strongly in the middle of the day when hypoglycaemia is prone to be induced (Fig 2) The persistence of the insulin retard effect into the next morning ensures that the morning dose of ordinary insulin required is considerably less than if the patient were taking two doses of ordinary insulin a day If this method proves unsuccessful the diet is modified so that breakfast contains 20 per cent of the total carbohydrate, lunch 30 per cent, tea 10 per cent and dinner 40 per cent

A different technique for zinc protamine insulin has been largely worked out by the Canadian physicians (Rabinowitch *et al*, 1936, Campbell *et al* 1936), and by Lawrence and Archer (1937) in this country In this the longer duration of action is exploited One dose of zinc protamine insulin is given before breakfast and at the same time a dose of ordinary insulin is administered Mixing of these two types of insulin results in a product whose action is little different from that of zinc protamine insulin, but with care the two solutions can be drawn without mixing into the same syringe and given as one injection (Campbell *et al*, 1936) The ordinary insulin controls the post-breakfast rise in sugar, and its action has weakened by the time the zinc protamine insulin is coming into full action For the next six or seven hours zinc protamine insulin is exerting its greatest effect and thus restraining the rise of sugar following the subsequent

be found to be less mobile, and thus more readily entered The large prominent veins of the aged are notoriously difficult to enter, and in these cases it is as well to transfix the vein transversely with a fine needle before carrying out the puncture When the veins are small and difficult to locate, if time permits it is useful to soak the arm in a hot bath for fifteen minutes before attempting the puncture When it is necessary to cut down upon a vein a small transverse incision is used If no veins can be seen an incision should be made over the commencement of the internal saphenous vein Even in a new-born infant we have never failed to find this just anterior to the internal malleolus There is no need to dissect out a vein with the point of a scalpel, blunt longitudinal dissection by opening the jaws of a small haemostat (Fig 2) is more efficient and saves time

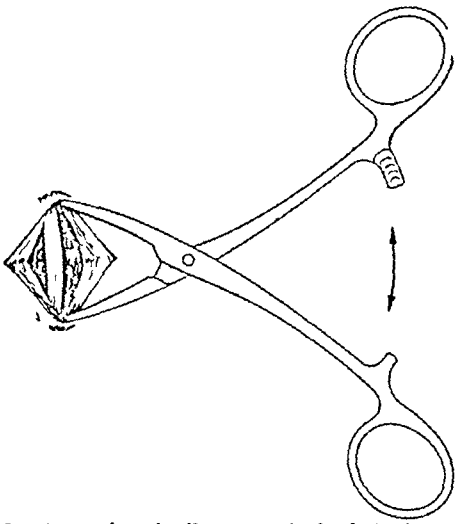

FIG 2—A rapid and efficient method of displacing a subcutaneous vein through a small transverse cutaneous incision

Splinting the Arm—A posterior plaster strip well padded with gamgee with a turn around the wrist forms an ideal splint readily adapted to each individual patient

Splinting the Leg—There is no better method than Thomas's knee splint, as described in a previous article

The Temperature of the Fluid

In spite of the many ingenious devices which have been invented for keeping the fluid warm we are still of the opinion that the simplest is the best—namely, the patient's leg or arm into which the saline solution is flowing should be kept warm with a hot-water bottle or a Q-pad In addition to simplicity this leaves the reservoir and the delivery tube in full view

The Administration

The actual administration is largely in the hands of the nursing staff It is of paramount importance to be sure that the nurse appreciates the simple yet vital responsibilities connected with the care of the apparatus and the maintenance of strict asepsis The nursing instructions are really very simple, and can be carried out by any conscientious State-registered nurse, providing that if she has not been trained in the method she receives special instructions With the help of a competent nurse there is no reason why continuous intravenous saline solution should not be administered to a patient in a private house, as contrasted with a fully equipped hospital

Nursing Instructions

1 Every portion of the apparatus must be freshly boiled and washed through with sterile water or saline solution before the reservoir is filled New rubber tubing should be boiled, stretched, and washed through to remove chemicals before the apparatus is assembled

2 Every utensil used in the transfer of the saline to the reservoir must be absolutely sterile (Fig 3)

3 To prevent the entry of bacteria from the air the top of the reservoir must be covered with sterile gauze

4 The reservoir must always be kept more than half full of saline solution

5 The patient's limb into which the solution is flowing should be kept warm with a hot-water bottle or Q pad

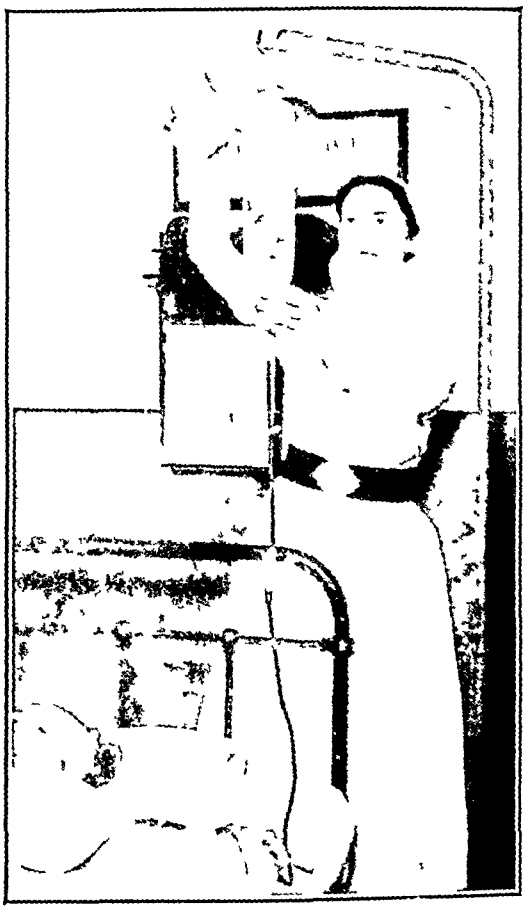

FIG 3—Replenishing the reservoir

6 The average rate of flow is fifty drops per minute This should be timed at frequent intervals Fifty drops per minute is about a quarter of a pint per hour—six pints in twenty-four hours

7 If the flow stops (*a*) do not pinch the tubing, (*b*) see if the tubing is kinked (*c*) if the flow is not restarted by some simple adjustment of the limb or the tubing report the matter at once

8 Watch for and report immediately (*a*) rigors, (*b*) redness along the vein (*c*) oedema of the feet, face, or arms, and (*d*) any sign of respiratory distress

9 Measure the amount of urine the patient has passed If the output is less than the intake report the matter Also report if the specific gravity becomes low

Special Instructions for the Medical Officer

1 If the patient does not appear to be responding take the blood pressure Intravenous saline infusion should not be continued in the presence of a falling blood pressure

2 Especially after forty-eight hours watch the bases of the lung for signs of oedema

3 Watch the urinary output, paying particular attention to the specific gravity

meals Later, the action still persisting the disease is controlled during the night I may add that we have not always found this happy sequence of effects The development of zinc protamine insulin action may be so long delayed that the full effect of the morning dose does not appear until the evening, with the result that the later meals of the day are inadequately controlled In such cases the full action of the insulin develops during the night and persists well into the next day so that the rise in the sugar content of the body following breakfast is suppressed (Fig 1 zinc protamine insulin curves) A perfect result can be obtained in such cases by giving a small dose of insulin retard instead of ordinary insulin, along with the zinc protamine insulin

Principles of Treatment

It is now possible for us to see the indication for the employment of these new insulins, and to formulate, tentatively, principles which should govern their administration

The protamine insulins are indicated in those cases in which nocturnal glycosuria reveals that ordinary insulin has failed to control the disease during the night, in patients in whom exercise is especially liable to produce hypoglycaemia, and when reduction of the number of daily injections is desired The principle governing their administration is that the protamine insulins should have as their first object the control of the disease during the night and only as their second object the restraint of the morbidly exaggerated rises in the sugar content of the body which occur after meals It is only in mild cases that the new preparations may legitimately be expected to control the disease during the whole twenty four hours (Fig 3) In cases of any severity their action should be reinforced by the administration of ordinary insulin at those times when a sudden influx of sugar from the intestine is found to overwhelm their mild action An analogy may be drawn between the use of the new insulin and a modern technique in anaesthesia The protamine insulins are comparable to the basal anaesthetics whose effect is both mild and prolonged ordinary insulin is comparable to the volatile anaesthetic which is superimposed at times when stronger control is required

Translating these generalizations into practical terms we may say that the dose of protamine insulin should be increased in accordance with its particular technique, until the urine formed during sleep is free from sugar If when this has been achieved glycosuria persists, after breakfast an auxiliary dose of ordinary insulin should be given and increased until the urine formed in the second half of the morning is free from sugar In the present state of our knowledge the danger of hypoglycaemia renders it hazardous to attempt to free from sugar the urine passed in the three hours following breakfast We should aim at keeping a trace of sugar always in this specimen and if freedom from glycosuria occurs here the dose of both the new insulin and the ordinary insulin should be reduced until sugar again reappears

Case Reports

The following cases illustrate various aspects of the use of the protamine insulins

CASE I

A man of 65 years was admitted with a history of diabetes for four years He was given a diet of 1 750 calories (carbohydrate 178 grammes protein 80 grammes fat 80 grammes) and was found to require insulin Ultimately he was receiving 40 units a day (15, 10 15) and yet his disease was not adequately controlled After three weeks on this diet and this dose of ordinary insulin blood sugar estimations were made throughout the twenty four hours (Fig 3) Doses of 40 units of zinc protamine insulin were then given one hour before breakfast and the same diet continued After a fortnight of such treatment the second series of blood sugar estimations were made (Fig 3) It will be seen that 40 units of zinc protamine insulin adequately controlled the disease An attempt was then made to substitute 30 units of insulin retard but this proved inadequate to prevent the rise of sugar in the body during the night

This patient is an example of those cases which while too severe to be controlled by one injection of insulin retard, are sufficiently mild to be controlled by one injection of zinc protamine insulin

CASE II

A girl aged 16 years who had been treated for diabetes for seven years on admission to hospital was grossly unbalanced but showed only traces of ketones She was given a diet of 1 500 calories (carbohydrate 146 grammes protein 80 grammes fat 66 grammes) and the insulin was raised until she was taking 75 units a day (30 20 25) The disease was not controlled after ten days of such treatment when the urine sugar curve in Fig 2 was obtained She was then given 20 units of ordinary insulin before breakfast and 40 units of insulin retard at tea time and continued with the same diet The urine sugar curve after a fortnight of this regime is shown in Fig 2 She was discharged on this diet and this dosage but because of hypoglycaemic attacks in the middle of the morning the dose of insulin retard was subsequently reduced to 35 units She has continued with the same doses of insulin but the diet has since been raised to 2 000 calories (carbohydrate 208 grammes protein 80 grammes fat 94 grammes) For the past year she has been in the best of health working and playing hard and has only occasionally passed traces of sugar

CASE III

A man of 26 years who was found to have diabetes mellitus eleven years ago was treated then with insulin and a low carbohydrate diet His insulin requirements gradually rose and he came to take 50 units a day (25 0 25) Two years ago he was given a diet of 1 750 calories (carbohydrate 178 grammes protein 80 grammes fat 80 grammes) and this necessitated no increase in insulin dosage An acute infection in the autumn of 1936 unbalanced him and in January 1937, he was admitted for rebalancing

In hospital he was given the same diet and the insulin was raised to 60 units a day (25 15 20) On this dose of insulin some of the urine specimens became sugar free for the first time After ten days of this dosage the blood sugar and urine sugar curves marked ordinary insulin (Fig 1) were obtained He was then changed to 60 units of insulin retard one hour before breakfast The same diet continued to be given After ten days on this diet the blood sugar and urine sugar curves marked retard (Fig 1) were taken The insulin retard was then replaced by 60 units of zinc protamine insulin given one hour before breakfast but two days later the occurrence of a severe hypoglycaemic attack in the middle of the morning necessitated a decrease of dosage to 50 units After one week on zinc protamine insulin the curves thus labelled (Fig 1) were obtained

This case illustrates several points With ordinary insulin the sugar content of the body rose in the late evening and during the night with insulin retard this rise was delayed to the early hours of the morning with zinc protamine insulin the nocturnal rise was abolished and the only evidence of escape of the disease from control was in the late afternoon and early evening when that day's dose of insulin not yet being in full action the action of the previous day's insulin was waning It is noteworthy that while taking ordinary insulin acetone appeared in the urine during the night While taking the protamine insulins it was absent The speed with which the different insulins come into action is also demonstrated by this case, ordinary insulin acting quickly,

4 Unless there are definite indications to the contrary there is seldom need to continue the flow after the third day A good working rule is to remove the needle or cannula at the end of seventy two hours and if necessary to reinsert it into another vein after six or twelve hours

5 If the flow stops do not dissemble any part of the apparatus without due thought of the possibility of air embolism Rather remove the needle or cannula, and if necessary reinsert it into another vein

6 In some cases, especially when glucose is employed, redness and tenderness appears along the course of the vein This is hardly ever anything more than a chemical phlebitis, which soon settles down after the flow into that vein has been discontinued

Conclusion

A patient who is ill enough to warrant this form of therapy needs watchful care and attention The continuous administration of saline solution intravenously does not therefore add materially to the nursing or medical attention which such a patient requires

The advantages of this over other methods of administering saline solution are great the rate of flow and the amount of fluid given can be regulated with mathematical precision Like all good things the principal evil lies in its abuse, and the most obvious danger is oedema It should be realized that it is not until about eight pints of fluid have collected in the tissues, a quantity equal to the volume of the circulating blood itself that the sign of *pitting on pressure becomes manifest It would be* a very great help if there existed some simple test which would indicate when the patient had received sufficient fluid and that more would be harmful At the present time the only choice lies between an estimation of the plasma protein, which is far too complicated and time consuming for general application and the rough and ready method of charting the output of urine and its specific gravity in one column and the intake of all fluid in the other (see table) Providing that reasonable care

*Continuous Intravenous Saline Balance Sheet**

24 hours ending	Intake	Output
	Pints	Pints
	At 50 drops per minute	Urine { S G a m / S G p m }
	30 drops per minute	Vomitus
	drops p r minute	Normally 1½ pints { Faeces / Sweating and lungs say
	By mouth	
	Total	Total

* Pads of these charts can be obtained from the G U Manufacturing Co 28A Devonshire Street

is exercised the latter is enough for practical purposes A balance sheet of fluid loss and intake should be drawn up For loss of fluid by sweat lungs and normal defaecation a total of one and three quarter pints has to be calculated To this is added the urine output plus vomitus if necessary From this total the maintenance dose for the next twenty four hours can be calculated

CLIMATO-PHYSIOLOGICAL INVESTIGATIONS AT THE SEASHORE*

BY

OTTO KESTNER, M D

For nearly two hundred years convalescent children have been sent to the seaside, and it is generally known that this treatment is successful When, as a physiologist I began to study the curative power of the seashore I remembered that pharmacology had greatly increased the efficiency of drugs by modern methods of experimental study In recent years many investigations have been made upon children at the small seaside town of Wyk on the island of Foehr, on the German side of the North Sea where there are two large children s homes belonging to Berlin and Hamburg and a great number of smaller homes for convalescent children under national insurance The town built a small laboratory for us and the insurance organizations made a grant of some money Dr Haberlin who has practised in Wyk for more than thirty years and other local medical men were associated with me in this investigation

Physiological Effects of Climate

Medical climatology makes a true distinction between climates that are stimulating or bracing and those that are sheltered or sedative But a stimulating climate so called includes both the stimulus of the solar heat which we do not feel so bracing and the ultra violet rays of the sun which we do not feel at all Obviously climatic stimuli of all kinds—of the sunshine, wind, cold air, or rolling breaking waves—operate upon the body through the skin and it is true also that it is by means of the skin that the human body controls its temperature regulation by changing the size of the capillaries at different external temperatures

The observations which formed the basis of our work may be summarized as follows

1 There is a very rapid reaction of the capillaries (Haberlin, Kestner *et al* 1923) both dilating and contracting in healthy children living at the seaside

2 In pale weakly and undernourished children damaged by town life and sent by health officers or doctors to the seashore the same reactions occur but they are slower and weaker We found that these children not protected by immediate reactions lose many calories and that the temperature of the body falls considerably after the shortest sea baths even in August and even whilst merely playing on the seashore Such children cannot at first tolerate sea bathing but during the cure the capillaries gradually recover their normal gymnastic function The circulatory reactions improve week by week and the same children who felt terribly cold and cried at their first bath could play later on in the open air without clothing even in stormy weather The time and completeness or otherwise of the reaction can be determined and measured and these measurements are very helpful in checking the degree of exposure and the recovery of health This behaviour of the cutaneous circulation explains an observation of Curschmann He found that healthy young men mostly students had the same systolic blood pressure after sea bathing as before but that in patients with contracted blood vessels (arterial hypertonus) the blood pressure was lowered after a sea bath For this reason he called the seashore the paradise of the hypertonic

* Abstract of a lecture given to the Kensington Branch of the British Medical Association October 16 1936

† The reference to Dr Carl Haberlin s address reported in the *British Medical Journal* August 22 1931 (p 331)

insulin retard moderately so, and zinc protamine insulin being relatively delayed

Shortly after the last test shown in Fig 1 the man had a hypoglycaemic attack just before breakfast The dose of zinc protamine insulin was dropped to 40 units As it was feared that this reduction would permit much sugar to escape during the morning 10 units of ordinary insulin were given along with the zinc protamine insulin The patient was discharged on these doses and now appears to be satisfactorily controlled

NON-SURGICAL RENAL EMERGENCIES

A POST-GRADUATE LECTURE

BY

JAMES M. STALKER, M.D.

Physician Dundee Royal Infirmary

It would be an unprofitable exercise to attempt in one lecture an exhaustive survey of what I have called the non surgical emergencies of the kidney Suffice it, then, to recall that though there are rare conditions such as paroxysmal haemoglobinuria and less rare ones like the renal crisis of tabes dorsalis which are independent of any abnormal condition of the kidneys themselves, the great mass of the subject is concerned with some serious anomaly of the function of these organs

Starting with the kidney itself in a state of disorder, or with some developmental abnormality, or perhaps a constitutional weakness in the general vascular system which renders it incapable of standing up to the progress of wear and tear we may arrive at substantially the same end result That end result may take on a multiplicity of forms which we group under the term 'uraemia" It may be that uraemia is the most natural termination of life that we know, but at the same time in the face of every emergency, medical or surgical, that arises in practice we should ask ourselves the question "Ought this to have come about or were we in a position to prevent it? Acute illnesses such as a pneumonia or a fulminating appendicitis we will always meet without having had any forewarning of their approach, but there are other conditions of emergency which are recognizable in their pre emergency stage—a stage that ought never to be far from our minds

The boundary between the pre emergency and the emergency involving the function of the kidneys is so ill marked that it is easy to lose sight of it altogether, but its clinical recognition, by which I mean the bedside recognition, is so important that I stress it For it is generally easier to modify the life of an individual so as to bring it within the compass even of a grossly impaired kidney function than to persuade a completely arrested kidney to take up its role again

Illustrative Case No 1

Take the case of a woman who has passed the allotted span of years She has suffered in the last few years from a good deal of headache and pain about the back of the neck, her eyesight is not very good, she is breathless, and she has signs of aortic leakage without the large heart of the "aortic" patient in the prime of life her aortic valve is the seat of that slow sclerosing endocarditis which we know to be associated with some degree of granular kidney We are called to see her and find her breathless, but there is no obstruction to the breathing, the respirations are long and deep, there is a hyperpnoea rather than a dyspnoea She has been unable to sleep for a few nights, the skin is hot and dry, there are many moist rales all over the chest, and she has passed no more than a few ounces of urine during the last twenty four hours

She is within sight of acute uraemia How is she to be treated? Complete withdrawal of all food, abundant water to drink, a warm room and many blankets on the bed, and a large compress of antiphlogistine over the loins are the immediate indications and may achieve a very striking transformation, but the relief of such a condition is at best only temporary her kidneys are permanently impaired and secondary changes elsewhere are already established

Illustrative Case No 2

Here is a very different picture, where a situation which appeared desperate was fortunately got over, with, in all likelihood, little or no damage to the kidneys

A woman of 43 is troubled with oedema of the legs during the last weeks of her first pregnancy, but no changes are found in the urine An hour after her successful delivery she has an eclamptic fit and the urine is found to contain much protein In the next three days the amount of albumin steadily diminishes to little more than a trace, when it begins to rise again and she becomes very breathless She is admitted to hospital on the tenth day post partum She is very ill the pulse 108, the respirations 44 per minute, and the temperature 98·4°, she coughs much and brings up a purulent spit She is flushed, with a slight cyanosis, there is much oedema of the legs and back, there is a nasty burn on the dorsum of the left foot, a relic of the fit The urine becomes almost solid on boiling, the blood pressure is 174/88 The breath sounds are loud and harsh with many rales, mostly dry A large needle is inserted into a vein in front of the elbow and a few ounces of dark viscid blood are withdrawn, but clotting in the needle is so rapid that the vein is exposed by dissection and a cannula inserted The cannula too is quickly blocked, and in all not more than eight ounces of blood have been drawn and a like quantity of saline infused

Next morning the patient is in a parlous state A few more ounces of blood, not so dark and thick as on the previous evening are aspirated by syringe, more perhaps as a salve to the conscience than anything else The woman, rather stout and plethoric, is literally struggling for breath, but seems to get a measure of relief from oxygen administered by intranasal catheter She is coughing incessantly and bringing up much frothy sputum and there is a dusky cyanosis in spite of the oxygen Her distress is explained by an examination of the chest, there

3 Respiratory reactions It is a familiar fact that putting the feet in cold water is answered by deep breathing The cool air and the continual breezes of the seashore deepen the respiration and change the form of the chest (Haberlin and Krauel, 1933)

4 It has been demonstrated that exposure to bright sunshine raises the content of haemoglobin in undernourished anaemic children (Haberlin, Kestner, *et al*, 1923, and Haberlin and Krauel, 1933) When we began our investigation the children had dinner at midday and rested or slept after dinner for two or three hours The best hours of the day, therefore, were spent indoors, and play on the seashore was only possible in fair weather At that time we found a striking parallelism between the duration of sunshine and content of haemoglobin (Haberlin, Kestner, *et al* 1923) We then altered the scheme of daily life in the convalescent homes, and so arranged it that children could spend the time out of doors, even on days with only brief intervals of sunshine The weather changes often and suddenly on this island At the present time the children play out of doors for hours, even in winter, and for half an hour, twice daily, without clothing This they do with enjoyment even in the snow When we repeated our previous determinations we could not find any relation between sunshine and haemoglobin

It is one of the important practical results of these investigations that all these homes are now open throughout the year The doctors in charge now consider that the best results are obtained during the winter (Haberlin, 1928) These observations agree with the experience at Berck-sur-Mer It is evident, therefore, that ultra-violet rays cannot be the one and only active factor in the sea climate Haberlin found the proportion of ultra-violet rays in summer and winter as 330 to 1

5 The stimuli of the seashore increase human metabolism The astonishing extent of this increase both at marine and Alpine stations, and indeed as produced merely by exposure of the body to the open air, has been demonstrated by Sir Leonard Hill We studied the effects of exposing children and adults to the sun and air and found that the oxygen consumption was higher in the sunshine than in the shade (5–1 1) A rise could be observed if we exposed only the face and hands, but it was higher if the rays of the sun could touch the whole body Artificial light, so rich in ultra-violet rays, does not produce the same reaction This effect of the sun-bath is, however, at once lost if the body becomes heated, for the processes of oxidation (for example, in the liver) are diminished by heat Thus is explained one of the principal advantages of the seashore as compared with other health resorts—namely, the great stimulation of metabolism—for the incessant movement in the atmosphere has great cooling power and prevents disturbance of this stimulation by neutralizing the effects of solar heat

6 An increasing metabolism is the best criterion of a stimulating climate, both in the Alps and on the seashore It is always connected in children with a retention of nitrogen During the summer and winter we have had boys aged 6 to 8 under our care Before arriving at Wyk they spent ten or fourteen days in the clinic of the University Hospital in Hamburg on a diet containing calories, proteins, vitamins enough for maintenance, and they excreted in urine and faeces about the same quantity of nitrogen as they obtained in their food These children were then brought to one of the convalescent homes in Wyk, accompanied by the same nurse, and were put on exactly the same diet We found that the excretion of nitrogen was lowered from the third to the last day of a month, so that a daily retention of 0 6 to 1 gramme of nitrogen could be observed, equivalent to 400 to 600 grammes of new living tissue Physiology does not show any considerable storage of proteins in the body, retention of nitrogen must signify the building of new tissues and growth The sea climate, therefore, enables the human body to grow and build up tissues on the same diet which in a good hospital, where the children spend a good part of the day in the garden and play and live in the same way as by the sea, does not allow retention of nitrogen During a further period spent by these children in Hamburg no retention could be observed In another group of boys, who lived in the hospital as far as possible in the same way as on the seashore, and who were exposed daily to artificial ultra violet rays there was also no retention

7 This retention of nitrogen is in full accordance with Haberlin's determinations of the body weight of groups of children who lived for ten months of the year in a city and for two months at Wyk on Foehr Body weight and haemoglobin went up at the seashore and dropped or did not increase when they were in the city The whole life history of these children looks on the charts like a staircase The circumference of arms and legs increased by growth of the muscles the circumference of the abdomen decreased (Haberlin Kestner, *et al*, 1923 and Hering 1925)

8 A further important influence of the seashore is increased gastric secretion observed at Wyk by Maria Braun In both adults and children she found the hydrochloric acid and total acidity figures after the usual test meals higher than in Hamburg The increased appetite of people during their stay by the sea or on board steamers is probably connected with the rise of gastric secretion but it is not easy to give a physiological explanation of this rise of acidity as in the case of the fall of blood pressure by the improved reaction of the capillaries My investigation could not be finished so no explanations can be offered

Conclusion

Most of our investigations are made on children—pale, weak convalescent children It seems to be a rule that healthy, vigorous persons have very slight reactions to differences in climate They are not greatly disturbed by changes of environment A full measure of adaptability is a symptom of perfect health That may be the reason why many climatologists studying the influence of climates on themselves or on their friends and comrades have found surprisingly minute reactions

The stimuli of the seashore are sun air water, winds, and waves We do not at present know any others These stimuli exist only in the open air, not in the room of a hotel or a convalescent home This enables the medical man to control the dose Undoubtedly the complex must be different in different health resorts, and even in different parts of the same health resort Modern biology tells us that every living being elects the stimuli of its environment according to its ability to be influenced by them The living man is the instrument for investigations in medical climatology It appears that two climates can be very different for the meteorologist and nevertheless have the same influence upon our patients

is a widespread acute oedema of both lungs, and it is clear that fluid is accumulating in the air channels more rapidly than it is being got rid of She looks likely to die Most of us are dubious regarding the use of morphine in the presence of impaired kidney function, but Sir William Osler was a strong advocate of its employment in uraemia, and no one could say that Osler favoured short sighted enthusiasm I compromise giving this patient 1/20 grain of apomorphine hydrochloride hypodermically Ten minutes later she is reported to be in a more desperate state than ever, restless and delirious, but in the next hour or two she loses no more ground In fact the quality of the pulse seems to improve a little and she is getting rid of her copious spit with a little less effort Four hours after the first dose the apomorphine is repeated, and again in a few minutes she becomes notably confused In the course of the afternoon she is given an enema of an ounce of magnesium sulphate, two ounces of glycerin, and three ounces of water better known in the surgical wards as a flatus enema, but a preparation well adapted to rid the body of a large amount of water by the bowel This is a really drastic measure, which I only commend to your notice in the case of a water logged patient who is not too exhausted At 7 p m a third dose of apomorphine is given, and I am at least hopeful that our patient is not in such danger of drowning as she was in the morning At 10 p m it is clear that all other ends must be sacrificed to the necessity for sleep, and 1/4 grain of morphine with 1/100 grain of atropine is administered In the course of the night she gets a few hours uneasy sleep, and has further doses of apomorphine at 2 a m and 6 a m Twenty four hours have seen a striking improvement cyanosis is less the pulse is 84 the respirations have dropped from 60 the previous afternoon to 36, coughing is less insistent the lungs not so full The enema is repeated in the after noon, the apomorphine at 6 p m the morphine at 9 p m, and the apomorphine again at 3 30 a m Thereafter a satis factory convalescence sets in the bowels being kept active with jalap powder and magnesium sulphate by the mouth During the first few days of this illness there has been incontinence so that the amount of urine passed is diffi cult to state

You will have noted that the patient was very oedema tous and I attribute some of our success in the elimina tion of water to the presence of the burn on the dorsum of the foot an area of roughly twelve to fifteen square inches which literally poured out water for several days The mental disturbance shown in this case deserves a note There is no doubt as to an access of confusion after each dose of apomorphine but an equally striking disorder was a complete amnesia as to the events of a whole week before her admission to hospital this amnesia persisting up to her discharge six weeks later

Illustrative Case No 3

A woman of 59 had a breast removed for cancer seven years ago and as yet there is no recurrence She has been subject to infrequent attacks of asthma, relieved by expectorants She is taken ill with an attack of diarrhoea, with some pain in the chest and a pleural rub Her temperature rises to 102 , there are moist sounds in the right lung She perspires very freely for the first few days of this illness and then the skin becomes dry and she passes but little urine During the seventh day she passes no urine but the bowels still tend to be loose there is slight fever and she is becoming drowsy In the evening she shows some mental confusion she complains of head ache the blood pressure is 150/80, the breathing is em-barrassed, the optic disks show a heightened colour Three hours later she is only semi conscious and has become restless and rather noisy, she does not recognize a familiar face or voice A few ounces of blood are with difficulty, drawn from a vein in the arm It is thick and dark At 1 a m she is given 1/20 grain of apomor-phine At 4 45 a m she is so noisy that 1/4 grain of mor-phine is given At 10 a m she is almost comatose but there is considerable resistance as I insert a spinal needle She has passed a stool containing much blood in shreds the skin is dry the breathing difficult and her pallid face reflects that slaty grey cyanosis which we so dislike to see The apomorphine is repeated, and the next two hours see some hopeful perspiration but an hour later she is once more dry restless, and noisy Oxygen is being delivered by the nasal catheter, and again she is quieted with 1/4 grain of morphine In the evening barely con scious she is able to swallow 3 drachms of the syrup of chloral and the loin pack of antiphlogistine is applied At 11 15 p m apormorphine at 2 30 a m morphine and in the morning she is to all appearance *in extremis*—we actually note that curious delineation of the nasal carti lages which always seems to say that a fatal issue is not far distant At 10 45 a m I return to the apomorphine, and instruct that it be given every four hours or sooner if she should again become restless and that nothing else be given

Twenty four hours later she is conscious but wildly confused She recognizes her husband she recognizes myself, and when I offer her ice cream she roundly abuses me for having withheld that delicacy so long She is now coughing and has a free expectoration and during the day she takes abundant water A bromide and chloral sedative in the afternoon 3 grains of soneryl at night and next morning her confusion is lessening Sleep on the following night is appreciably aided by 1½ drachms of paraldehyde, and the mental condition is now clear she is passing a satisfactory amount of urine, the systolic blood pressure has dropped to 134 and the acute uraemia may be said to have been weathered Here too there was a retrograde amnesia of about five days antecedent to her admission to hospital

Nitrogen Retention

I come now to an observation in these two cases on which I have so far laid no stress—the blood urea We are accustomed to think of this estimation as a chapter in the modern development of blood analysis but the first note on increased nitrogenous retention in chronic nephritis came from the collaborators of Richard Bright himself more than a century ago It remained to their successors to show that urea could be fed to the body till its concentration in the body fluids was equal to that seen in uraemia without causing symptoms of that dis order It follows, then that a high blood urea is not diagnostic of uraemia and that we are not better placed in the matter of diagnosis when we have our colleagues of the laboratory at our immediate call than when we are dependent on our own unaided faculties Uraemia is a syndrome which is recognizable at the bedside be it in the clinic the castle, or the croft It is really after the condition has been recognized that the degree of nitrogenous retention should be estimated for it does go some way to tell us what kind of kidneys we are dealing with what hope there is that we can induce them to take up their proper role again what likelihood of our patient resuming if not a normal life, at least a life of modified usefulness

Clinical Memoranda

A Sporadic Case of Encephalitis Lethargica

In the island of Jersey the condition of encephalitis lethargica is almost unknown This case presented unusual difficulty of diagnosis, which prevented its early recognition as will be easily appreciated from the report there seems, however, no reasonable doubt as to its correctness

CASE RECORD

A female aged 33 first came under observation in 1930 when she had a large pyonephrosis on the right side Nephrectomy was performed with uninterrupted recovery on examination the tumour revealed only fibrous tissue and pus no renal substance remaining The patient complained of some frequency of micturition particularly nocturnal after the operation

In 1931 the frequency of micturition called for treatment because the patient had to rise from nine to twelve times a night No marked physical signs were apparent the urine was acid with a trace of albumin and some pus cells bacilli of the *coli* group were present Hexamine was given with some improvement.

In 1934 frequency of micturition which had never completely disappeared again became very troublesome and as it resisted medical treatment and bladder lavage she elected to go to London and was admitted to the Westminster Hospital under the care of Mr Arthur Evans Cystoscopy revealed some ulceration of the bladder and cystitis the left urethral orifice was enlarged and the bladder capacity small Intravenous pyelography showed normal filling of the renal pelvis and ureter and no sign of stone Hexamine was administered and bladder washes with silver nitrate and oxycyanide of mercury given but the urine remained as reported above The patient was placed on a ketonic diet without any marked result Treatment with the *B acidophilus* was likewise unattended with improvement and the patient returned to her home

She was then given intravenous injections of cylotropin 5 c cm every other day ten injections in all with marked benefit nocturnal frequency being reduced to three times in the night Treatment was discontinued and the patient remained in this state for about two years

On October 5 1936 the patient again presented herself this time complaining of headache and drowsiness Examination revealed no physical signs and the condition was regarded as uraemic No pyrexia was present she was placed on a suitable diet and given diuretics she continued to work in her home October 10 drowsiness and headache increasing patient liable to go to sleep anywhere and at any time she also complained of blurring of vision—examination of the optic disks revealed nothing Urea concentration test gave a negative result and the blood urea was found to be 41 5 mg per 100 c cm This, of course upset the diagnosis of uraemia

The patient continued to get gradually worse An examination of the cerebro spinal fluid gave 0 02 per cent protein cells mainly lymphocytes 1 per c mm and a few red blood cells On October 31 she took to her bed with increasing lethargy and somnolence The temperature which had been irregularly subnormal suddenly rose for a few hours to 103 F only to fall and remain at its previous level Further careful examination showed no physical signs other than very doubtful bilateral Babinski plantar reflexes She now exhibited a change of character from being a very reserved and shy woman she showed a tendency to indecent conversation and exposure

November 11 muscles of deglutition becoming paralysed progressive difficulty in swallowing solids incontinence developing largely because she cannot be bothered November 15 severe haemorrhage occurred from the vagina and persisted for about forty eight hours November 16 patient became comatose November 17 death supervened in the state of coma

COMMENTARY

The outstanding features of this case were (1) headache which was persistent and mainly frontal, (2) lethargy which was at first associated with somnolence and later with insomnia (3) dimness of vision (4) complete absence of physical signs

The difficulty of diagnosis was in the main due to her previous renal history Unfortunately permission for a post mortem examination could not be obtained

Haemolytic Streptococcal Meningitis Treated with Prontosil Recovery

I believe the following case of streptococcal meningitis successfully treated with prontosil is worthy of record

CASE REPORT

A boy aged 9 years was admitted to hospital on October 6 1936 with the signs of acute meningitis The child had marked neck rigidity and a positive Kernig s sign and was complaining of pain in his back On admission his temperature was 101 8 pulse 128 respirations 28 The child was very thin and looked neglected The history was that he had not been well for two weeks and had a discharging ear Lumbar puncture was performed the cerebro spinal fluid was clear but under a pressure of 220 mm C S F No abnormalities were found in the cerebro spinal fluid except for a slight reduction in the chlorides to 680 mg The physical signs increased the pyrexia persisted and lumbar puncture was repeated three days later The fluid was now turbid and under increased pressure Mulford s polyvalent anti meningococcal serum was given intrathecally and intravenously The cerebro spinal fluid was sent to the Birmingham University laboratory for examination and beta haemolytic streptococci were reported in pure culture

Anti meningococcal serum was repeated intravenously the next day with no reduction of temperature On having the report of the presence of streptococci prontosil was administered on October 13 10 c cm was given intramuscularly daily and two tablets by the mouth three times a day After thirty six hours of treatment with prontosil the temperature became normal Lumbar puncture performed on October 16 and 20 yielded thick pus and beta haemolytic streptococci were again reported in pure culture Three doses of 20 c cm of anti scarlatinal serum were also given intravenously but not until after the temperature had returned to normal Prontosil was continued for eight days The patient continued to improve and by November 5 there was no head retraction but Kernig s sign was still positive A week later the child appeared perfectly normal and had no Kernig s sign By the end of November the child was up and has remained perfectly well

I am indebted to Mr E S Clayton M D F R C S Ed medical superintendent of the hospital for permission to record this case

"Uraemia"—A Note of Caution

We do not know with certainty how the symptoms of uraemia are determined, and I would warn you against the view that this is but a name for the terminal features of a chronic nephritis We speak of chronic uraemia and acute uraemia, and we recognize that a patient with the former is in danger of the latter, but whether it be the sudden maniacal seizure, the onset of convulsions, or the rapidly developing coma, these emergencies are so distinctive of the acute condition that it would seem proper to limit the term "uraemia" to this group, and to regard the chronic as the pre uraemic phase—a phase which has much in common with the acute disorder, but in which some further factor responsible for the catastrophe must, on the face of it, be lacking Scarcely a single feature has been demonstrated in a case of uraemia, but it has been shown to be present in a patient who was not suffering from uraemia The cerebral symptoms have been widely attributed to the very constant oedema of the brain which is found at necropsy, but oedema of the brain is also found in patients who have not to our knowledge had uraemia So it is with the findings during life this patient with uraemia has 100 milligrammes or more of urea in 100 c.cm of blood, this one with the same concentration of urea has no uraemia The toxaemia of eclampsia even when it introduces a picture which outwardly cannot be separated from uraemia, is not attended by any appreciable rise in the blood urea, 42 mg having been found in the patient I have described to you The second patient showed 95 mg at midnight and 125 at 10 a.m., undoubtedly an evil prognosis And yet, in a most readable chapter on diseases of the kidney, Boyd (1931) cites a case where a man injured in an accident had complete suppression of urine for a week and a blood urea rise to 200 mg without the least suggestion of uraemia in his condition

Emergencies cannot be provided to meet a pre arranged occasion I have sought, therefore, to show you to the best of my ability one or two word-pictures of illustrative cases met with in the last year or two, but it would be misleading to confine my remarks to instances on which we can look back with some satisfaction Here is a canvas of different hue

Illustrative Case No 4

A boy of 6 is seen in the out-patient department in August 1935 on account of constipation and loss of appetite a few moist sounds are noted in the chest a common enough finding and many such are admitted to the children's sanatorium One day in September he is noted to be a little puffy under the eyes and there is a trace of protein in the urine, but a week later this has gone and he remains clear Towards the end of November he has a slight cough and again there are rales in the chest and a trace of albumin in the water During the last week of the month his mother notices that his gums appear to have been bleeding in the morning, and for three days his motions have been black and he has complained of a sore head Then he vomits a large quantity of blood and he is brought into hospital On the next day he has a small epistaxis, there is cough but no adventitious signs in the lungs A little albumin is found in the urine, he is pale and has a considerable secondary anaemia Two days later he becomes very restless and talkative There is no fever he develops a squint and has double vision Then he becomes hemiplegic and falls to the weakened side when he sits up The cerebro-spinal fluid is not under pressure Next morning convulsive movements of the limbs lead up to a deepening coma, and this little patient dies An hour or two before the end the spinal theca is tapped again, and the pressure within is seen to be more than normal Subsequent analysis of the fluid reveals a urea content of 274 mg in 100 c.cm Too late we noted that though his urine showed no tube casts he was passing more than healthy kidneys should need to pass This boy had a narrowing of his urethra, probably developmental in origin, the bladder and ureters were widely dilated, the kidneys shrivelled and shrunken, completely played out I draw from this case the reminder that no age is exempt from uraemia, and that oliguria is not a necessary precursor of its onset

Attempts at Clarification

Nine-tenths or more of our present day knowledge of nephritis we owe to the master who first described it Bright's disease is still Bright's disease Over a full century one or another, clinician or anatomist, has tried to clarify our conception of the disorder by this or that terminology, to pigeon-hole, as it were, the various clinical entities or anatomical pictures which we meet only to find that the partitions between the pigeon-holes are as broken as the kidneys they contain Uraemia can occur in every form of the disease, the concomitant of every type of inflamed or degenerated kidney that we know and there is no denial that with a long history of nephritis, a long losing battle against the failing excretory powers of the body, the advent of this syndrome finds us helpless Yet we do less than our duty if we throw in our hand too soon, we must play it out to the last trick every time For there are cases of uraemia which can rightly be regarded as crises in the life of the human machine, and which may, with fortune's favour, be got over

Now a word from Richard Bright (1836)

> 'The first circumstance which strikes the mind is the extent and frequency to which the derangement of one organ is connected with the derangement of several others, yet we are not at liberty to assume that the disease of the kidney has been the primary cause on which the disease of the rest depended It may be that some other organ has first suffered and that the kidneys, together with the rest have become involved I confess I am inclined to believe that the kidney is the chief promoter of the other derangements The only organ except the kidney which I think, on taking a review of the history of this disease, might probably act as the primary cause, is the skin, and this is so closely connected in its derangements with the kidney that the relation of their lesions, as regards cause and effect, becomes equivocal
>
> In almost every case the first impression which brings on the anasarca is suppression of perspiration

This reference by Bright to the skin as a possible factor in the causation of nephritis is of some interest, for it is in the management of the disease rather than in the causation that the skin has been the subject of most attention In point of fact we reached the anomalous position which we still retained up till twenty years ago, that though we ignored the skin in our views of the aetiology except in cases following extensive burning, we gave it pride of place in the treatment We are more consistent to day, gone are the hot packs ousted by the radiant heat bath until an unhappy patient, perspiring freely, came into contact with a bad insulation and was electrocuted but the hot pack has never regained its once honoured place—honoured perhaps by ourselves alone, for it had long been damned by the nursing profession So for a moment I

Reviews

THE NATURE OF CANCER

Principles and Problems of Cancer Research in Regard to Etiology and Nature. By William Rienhoff, sen., M.D., I.A.C.S. (Pp. 200.) Baltimore: Waverley Press. 1936.

That Dr. William Rienhoff's book is no ordinary medical treatise may be judged from the fact that its bibliography of 611 items includes ten references to the Bible, eleven to the works of Goethe and others to Horace, Schiller, Kant, Einstein and Shakespeare. It is, nevertheless, an attempt to appraise the cancer problem as a whole and this apparently extraneous matter plays its part largely in giving a literary flavour to the author's criticisms of present-day belief. Although some of his more severe castigations are directed to those who use expressions without definite meaning and presumably think in an equally nebulous fashion it has to be said that his own ideas are sometimes clothed in language which it is far from easy to follow. No one however, can complain that there is anything obscure in his final conclusions since these declare dogmatically that cancer is a virus disease and even go so far as to add statements about the distribution of this virus and the mode of its transmission. other "apparent co-operative factors" are 'but chanceful preliminaries'. It is well as the author says, that we should sometimes try to see the whole rather than a part, and the serious student of the cancer problem will find parts of this book helpful in trying to do so. But we need not consequently force a general conclusion unwarranted by facts. Not long ago Peyton Rous said it would be a pity if the final solution of this problem did not prove to involve some new biological principle. These words recur to mind with some force before the spectacle of someone who appears content with a very incomplete explanation on very orthodox lines.

THE MECHANISM OF ABSORPTION

Absorption from the Intestine. By F. Verzár assisted by F. J. McDougall, Ph.D. (Pp. 294; 70 figures. 21s. net.) London: Longmans, Green and Co. 1936.

This monograph is a comprehensive study of the mechanism of absorption and a serious attempt to bring the whole question into harmony. The experimental work is spread over the role of biles in absorption of hydrotropy, of hydrostatic pressure, the absorption of water and salts, the absorption of fat and the synthesis of neutral fat, absorption of carbohydrate, of bile acids, of sterols (especially cholesterol) xanthophyll bilirubin and flavine, absorption of amino acids of adrenal cortex, and of morphological particles and the histology of absorption.

The main problem is taken to be whether it is possible to explain the facts of absorption from the intestine in physio-chemical terms. It was found that diffusion and osmosis are the chief forces, and that inhibition plays a part. There is in the absorption of certain substances a special selective advantage which seems to be completely contrary to physical laws since from a mixture of hexoses and pentoses glucose and galactose are selectively and quickly absorbed. In the case of sterols there is also a selective absorption of cholesterol in comparison with other sterols which seems to be true also for xanthophyll and flavine but the study of these cases shows that there are active processes in the cells of the intestinal mucosa which influence absorption. It is shown that the phosphorylation processes in the intestinal mucosa are under the influence of the hormone of the adrenal cortex, as are the phosphorylation processes in the muscles. If the adrenal cortex is destroyed the selective absorption of glucose and also of fat absorption is abolished. The incomplete fat absorption in Addison's disease pellagra, sprue, Gee Herter's disease and B avitaminosis can be explained by the disturbance in the function of the adrenal cortex in these conditions.

Fat absorption is dealt with in a manner remarkable for its clarity and this should do a good deal to clear up the conflicting views put forward hitherto. Fat is absorbed only after being split up in the intestines by lipase the fatty acids then continue with the paired bile acids to form molecular complexes water soluble diffusible and specially stable in the slightly acid reaction of the intestine these complexes are broken down in the mucosal cell and the bile acids are absorbed in the mucosal epithelium dissolving a greater quantity of fatty acids than *in vitro*. The fatty acid combines with glycerol to resynthesize neutral fat. The synthesis of neutral fat via the formation of a phosphatide is an accelerating factor in the absorption of fat and may produce the specific fats of the body and render the fatty acids non-toxic. The lecithin content of the blood is increased during fat absorption. The intermediate synthesis of the fatty acids to phospholipoids can be inhibited by mono-iodo-acetic acid and by phloridzin drugs which *inhibit indirectly* phosphorylation processes.

This book is a notable contribution to a complex subject and deserves careful study. It is excellently supplemented by a comprehensive and well-classified bibliography.

A GYNAECOLOGICAL TEXTBOOK

A Textbook of Gynaecology. For Students and Practitioners. By James Young, D.S.O., M.D., F.R.C.S.Ed., F.C.O.G. Fourth edition revised. (Pp. 417; 221 figures. 16s. net.) London: A. and C. Black. 1936.

The fact that a fourth follows within three years the third edition is proof that Professor James Young's text-book meets a need and is appreciated. The main changes in this edition are in the chapters dealing with sex hormones and although it is probable that statements now included will have to be withdrawn in later editions their inclusion is presumably necessary if the student is to pass his examinations. The section on ovarian neoplasms includes the more recently described tumours. A healthy sanity and conservatism pervades the book, giving it a special appeal to the general practitioner. The sections dealing with leucorrhoea, pain and backache incorporate the author's contribution to this important syndrome.

There are but few statements with which the gynaecologist could disagree but fibroids do sometimes grow after the menopause and Schauta's disciples can remove the malignant uterus by the vaginal route. The illustrations on the whole are poor—particularly those depicting vesico-vaginal fistula and vaginal hysterectomy—but the semi-diagrammatic histological drawings do convey clearly the main features described. The x-ray picture after injection of lipiodol (Fig. 46, p. 111) gives no certain indication that the tubes are normal particularly as no statement is made of the time which had elapsed after the injection was made. These minor criticisms but serve to indicate the general excellence of the book, and we know of no better textbook for the student or the practitioner—for whom it was written.

somewhat ambiguous term 'reliability' Strictly speaking the reliability or, better the consistency of the medical examination is not made out in this research, valuable and informative as it is in other respects, and not least in that which involves 'validity' as determined by the follow up inquiry of the final medical examination The prognostic value of the combined examination in the third year seems fairly well established and the coefficient of correlation ($r = +0.66 \pm 0.02$) between it and the final is I think higher than any similar figure arrived at in previous researches of a like nature It would be of great interest and value if this type of investigation were extended to other medical schools and the results compared —I am, etc,

Edinburgh Dec 17th 1936 JOHN L HARDIE

The College of Surgeons and its Members

SIR —At long last the Council of the Royal College of Surgeons of England has broken silence and given consdered replies (can one call them reasons?) to the century-old request of the Members for some representation on its Council What are they?

1 The main function of the College is to promote the study and practice of surgery' Have the Members who are nine tenths of the College and are the largest body of practising surgeons in England no interest in the study and practice of surgery?

2 An opportunity for discussing matters is afforded at the annual meeting of Fellows and Members' In recent years many occasions have occurred when no statutory annual meeting has taken place owing to these present being one or two short of the necessary quorum of thirty, although the President and many members of the Council were there but by a unique regulation of the Council they are not qualified to form part of the quorum The quorum of the House of Lords is four, that of the House of Commons is thirty—the same number as the College—but the members of the Cabinet are not disfranchised for the purpose of a quorum When the annual meeting does take place the report of the Council refers only to matters which have been dealt with in the past year and are already *faits accomplis* as occurred recently on several occasions Too late was the reply in reference to them

3 Representations made to it [the Council] by any Member or body of Members will receive careful consideration' This is a poor substitute for representative Members having an opportunity of setting out the views of Members on questions as they arise at Council meetings—the effective time—or of presenting and discussing thereat matters referred to them by their brother Members

The poverty of the response of the Council to the resolution passed at the last annual meeting is a great contrast to the wealth of the arguments which have been brought forward in favour of representation of Members on the Council in the interests of the College, its Members and the public—I am, etc

London SW1 Dec 18th REDMOND ROCHE

Rhythmical Agranulocytosis

SIR —Dr Embleton has reported an interesting case showing conspicuous blood changes without loss of health (*Journal* December 19th, 1936 p 1258) I do not blame him for current synthetic nomenclature but I think its inaccuracy begets confusion Leucocytes fall naturally into two groups granulocytes having specific eosinophil or neutrophil granules, and agranulocytes having neither The latter occur in all vertebrates and are the only leucocytes in fishes, the former appear in amphibia and gradually increasing in importance predominate in mammals Now the point is that no vertebrate can do without agranulocytes, and Dr Embleton shows that even man can manage without granulocytes for a time Assuming that a normal count is neutrophils 5 000 lymphocytes 2 000 and monocytes 350 his chart shows not rhythmical but continuous moderate agranulocytosis as one would expect Considerable agranulopenia is rare and of evil omen

Granulopenia however is common enough and in man eosinophils are so often suppressed that they must be highly specialized and of use only in exceptional circumstances Eosinopenia, therefore is negligible and the familiar term neutropenia may be safely substituted for granulopenia Neutrophils are more generally useful and react so energetically to our frequent coccal infections that they are almost indispensable but it is well known that they are unduly sensitive to certain toxic influences In peritonitis Dr Piney has reported a total white count of 900 per c mm, of which 780 were lymphocytes and throughout the second and third weeks of typhoid fever eosinophils are suppressed and neutrophils may fall to 1 000 per c mm without harm if the agranulocytes do their duty as in Dr Embleton's case in which there are recurrent periods of complete neutropenia during which the monocytes invariably rise to the occasion These the most primitive of leucocytes seem to be all rounders and often play the leading part—for example in malaria kala-azar and glandular fever (infective mononucleosis) Therefore, so long as nomenclature is based on the blood condition Schilling's term malignant neutropenia is greatly to be preferred for most of these cases and for those like Dr Embleton's recurrent or rhythmical neutropenia sufficiently emphasizes the really outstanding abnormality which is always attended by pyrexia ulcers in the mouth and disintegration of erythrocytes with a consequent great increase of blood platelets —I am etc

West Ealing Dec 28th 1936 ROBERT CRAIK

A Case of Locked Twins

SIR —In view of the rarity of this condition I am sending you a report of a case recently seen in St Thomas's Hospital which may be of interest

The patient aged 30 2 para was admitted to hospital on October 27th with mild albuminuria which responded well to rest and diet An x ray examination confirmed the presence of twins the first presenting by the breech the second by the vertex

On November 11th she went into labour the first stage lasted seven hours After one and a half hours in the second stage the first child a breech was born spontaneously as far as its umbilicus the arms were easily brought down but no further progress occurred On internal examination the head of the second child was found to have entered the pelvis below that of the first thus obstructing delivery Owing to the small size of the foetus it was fortunately possible to push up the second head whereon the first child was easily delivered The child had made several inspiratory efforts *in utero* and was in a state of white asphyxia but revived within a few minutes The second child was born without difficulty after half an hour The respective weights were 4 lb 11 oz and 4 lb 6 oz.

The puerperium was quite uneventful

SURGEON'S LIABILITY FOR NURSE'S NEGLIGENCE

INGRAM v FITZGERALD

The Court of Appeal of New Zealand, consisting of five judges, gave judgement recently on an interesting point of law (to which our Wellington correspondent referred in the *Journal* of December 12th, 1936, p 1221) whether the surgeon in charge of an operation can be held liable for the negligence of a nurse when he has not himself been negligent The facts were simple, and were admitted It was an assistant nurse's business to paint the abdomen of the patient with tincture of iodine, and through her negligence in misplacing the containers she painted the abdomen with *iodized phenol* There were two immediately consecutive operations on the same patient, and the phenol was correctly used in the first and then wrongly placed on the tray holding the tincture of iodine The surgeon discovered the error very soon afterwards, and took prompt measures The action was removed into the Court of Appeal by consent, so that the learned judges could decide whether the surgeon was liable in law

The Judgement

Mr Justice Kennedy, delivering the judgement of the Court, said that the contention of the patient was that the surgeon had the right or power to control the nurses in the operating theatre, that they were his servants, and that he must answer for their negligence This submission seemed to impose an intolerable burden upon the surgeon, for it would impose upon him the legal responsibility for negligence in the theatre even though he himself had exercised all possible care and even though it was wholly impossible for him to guard against or prevent the damage The Court must inquire what the surgeon had undertaken to do and what had been negligently done, whether the negligent act was done by some person put into the surgeon's place to do an act which he intended to have done as for himself, or whether it was done by an independent collaborator upon whom he was entitled to rely Under the conditions of modern surgery, observed the judge, it is impossible for the surgeon himself to do the whole work of an abdominal operation, and, in following the usual course of having the work done by a team, he was consulting not his own convenience but the interests of the patient Thus the preliminary painting, the preparation in the theatre, the sterilizing of the instruments, and the final painting were generally performed by the nurses The theatre sister and the assistant nurses were supplied by the private hospital where the operation was performed, and they thus had *independent duties to carry out*

In the circumstances the Court thought that the proper inference was that the surgeon did not undertake personally to do all the work necessarily involved in the operation, including the preliminary painting He must rather have undertaken to perform the operation in the hospital selected, with the appliances there available, and with the assistance and co operation of qualified, competent, and experienced nurses attached to the hospital It was true that he was in supreme control and had the right and the duty to intervene The persons subject to that control were, however, skilled collaborators with independent duties, and he did not find it necessary, nor would he expect to find it necessary, to intervene to direct the manner in which they discharged those duties They were not his delegates in the sense that they were there to do the work which he had contracted to do or to have done They were for general purposes the servants of the hospital but in the theatre they were subject to his directions The Court therefore found that the surgeon was not liable for the negligence proved against the nurse

Commentary

This decision is of special interest because the circumstances are in no way exceptional The hospital was a private hospital, but the position would have been the same if it had been a voluntary hospital or even a municipal hospital The question of the surgeon's liability for the negligence of a nurse usually arises when a swab or an instrument has been left in In James v Dunlop[1] a woman surgeon was held to be liable because the jury found that she did not make such personal search in the wound as was reasonable and proper and was not justified in closing the wound without making more extensive search than she had made In that case, however, the surgeon was unable to call the theatre sister as a witness and her defence was therefore handicapped In Crotch v Miles[2] a patient sued a surgeon alleging that he had left a pair of forceps in her body at operation Lord Hewart, the Lord Chief Justice, made some observations in his summing-up which must be taken to set out correctly the law on the subject He said that, although in the actual course of the operation the surgeon is not to be expected to busy himself with the counting of instruments or swabs, yet after the wound has been stitched up it is reasonable that he should personally satisfy himself that nothing is missing His lordship then pointed out that the jury must ask themselves whether the surgeon on the day in question ought personally to have counted the instruments or whether he was entitled to say that it was the job of the skilled theatre sister and that he was entitled to act upon her report, remarking "She is not his servant, she is one of the team We can all make mistakes" They had to ask themselves the question whether it was a breach of duty on the surgeon's part that the theatre sister miscounted (always assuming that she did), and he added that they might think that the question was linked up with the question what the surgeon did after the operation was over In the event the jury were not satisfied that the forceps had been left in at that operation at all

In Van Wyk v Lewis,[3] where a swab was left in, the appellate division of the Supreme Court of South Africa found that the surgeon could not be held responsible in that particular case It observed that the operating surgeon no doubt has control of the operating room or theatre, and circumstances may arise where he may become liable for the acts of the nurse or sister in attendance One of the judges, however, said that the relation of a nurse to a surgeon is not even analogous to that of master and servant, she is an independent assistant of the surgeon though under his control in respect of the operation "The surgeon does not ensure that he will be responsible for every misfeasance of the nurse To make him so would make his position intolerable"

In the present case the assistant nurse placed the beaker containing iodized phenol in the dangerous position while the surgeon was scrubbing up and long before it was applied to the patient It was never suggested that the surgeon was at fault because the two liquids were kept in similar containers There seems to have been no stage at which he could possibly have discovered the error before the damage was done, and there seems little doubt that the learned judges of the New Zealand Supreme Court came to their unanimous conclusion on good grounds The test apparently must always be in the particular *circumstances of the case* could the surgeon reasonably have been expected to supervise or check the actions of the assistant and to intervene if a mistake was committed?

A SIXTEENTH CENTURY HYGIENIST

The Wisdom of Andrew Boorde Edited with an introduction and notes by H Edmund Poole Illustrated by A E Christopherson (Pp 63 Limited to 500 copies 500 for sale at 7s 6d) Leicester Edgar Backus The Garswood Press 1936

The beautifully printed and charmingly illustrated little book with this title is an abridged version of *The Dyetary of Helth* by Andrew Boorde with one page from his *Breuyary of Helth* prefixed to the rest of the work The introduction by the editor, Mr Edmund Poole, contains a short sketch of the life of Boorde and his scientific background He was born about 1490 at Cuckfield in Sussex studied at Oxford, was received into the Order of Carthusians while still under age, and in 1521 appointed Suffragan Bishop of Chichester In 1529 he was released from his vows and travelled in Europe to study medicine On his return the following year he set up in practice and counted among his patients the Duke of Norfolk, for whom he subsequently wrote *The Dyetary of Helth* and Thomas Cromwell, whose political agent he became After subsequent Continental tours, during which he wrote the *Breuyary of Helth* and the *Dyetary of Helth*, he settled in Winchester, where though he kept the Carthusian rules of fasting and wearing the hair shirt he was found guilty of fornication for which he was imprisoned in the Fleet Prison in London, and died in 1549 In addition to the two works mentioned, Boorde has been credited with the authorship of two jest books, *The Wise Men of Gotham* and *Tales of Scrogin* The selections from his works in the present volume contain shrewd advice concerning the preservation of health especially in relation to domestic hygiene, food, sleep clothing and the avoidance of mental worry

HYPERGLYCAEMIAS

Les Hyperglycemies Étude Clinique et Physiopathologique By Henri Warembourg (Pp 584 65 fr) Paris Masson et Cie 1936

Dr Warembourg of Lille has written the most extensive book on hyperglycaemias that has yet appeared It deals almost entirely with the physiological and pathological aspects of hyperglycaemia, and the short practical section on diabetes and its treatment is not important

The most interesting idea in the book, and indeed its *leitmotif* is the description and significance of a new test of carbohydrate metabolism— l'indice chromique residuel —which is difficult to describe and is not easy to translate and assess in value The author employs the method of Polonovski for the determination of total reducing substances in organic fluids After removal of proteins by tungstate precipitation the filtrate is boiled with sulphuric acid and an excess of bichromate and back titrated with hyposulphite The amount of decinormal bichromate oxidized in this process from 1 c cm of plasma is called the total chromic acid index From this the oxidation produced by glucose is subtracted and the result called the *residual* chromic acid index This is used as an index of the non glucose reducing substance of the blood, and measures (among other things) the intermediary products of sugar metabolism, glycerol and its derivatives, pyruvic and lactic acids, etc It is stated that its variations have important biological and clinical significance in diabetes and hyperglycaemias An increase in this residual reduction is said to be a more subtle and definite indication of disturbed carbohydrate metabolism than the more usual glucose tolerance test and it involves a simpler technique The book in most of its serious parts is full of references to this residual chromic acid index, but it is always difficult to tie its meaning down to tangible results or interpretations The reader will be annoyed at having to search for the meaning of this new test in a discursive text and never feeling clear about it And when we read in the general conclusions that the I C R is raised not only in hyperglycaemias but in hepatic insufficiencies, in obesity, in hypertension in heart failure in cancer, the purpose of this semi erudite book seems too elusive

In more practical and direct matters concerning hyperglycaemia in all varieties of disease we have had equal difficulty in finding a critical stability among the pros and cons in the literature quoted We hope if the book is much developed and republished, that brevity and clarity will be introduced

QUACKERY AND PSEUDO-MEDICINE

Nostrums and Quackery and Pseudo Medicine Vol 3 By Arthur J Cramp M D Foreword by George H Simmons, M D LL D (Pp 232 1 50 dollars) Chicago American Medical Association 1936

This valuable book has been compiled by Dr Arthur J Cramp on behalf of the American Medical Association, of whose Bureau of Investigation he was director for thirty years Unfortunately it concludes the work of the editor in this field, for he was compelled to retire in December, 1935, on account of ill health He has fought quackery for thirty years and produced volume 1 in 1911 and volume 2 in 1921 , the present volume was completed in 1930, but its publication was delayed by the financial depression

The new volume differs from the first two in that it is more condensed Hence it has more the character of a work of reference and contains fewer amusing tales of roguery than did the previous volumes On the other hand the 232 pages contain an extraordinary amount of compact information Among other notes which may be of special interest to our readers are two pages on the 'electronic reactions' of Abrams and an account of Dr Hay and his dietary theories The scope of the volume is best indicated by the fact that the index refers to nearly 1,500 remedies,' a considerable proportion of which are sold in this country Dr George H Simmons Editor Emeritus of the *Journal of the American Medical Association* who during a quarter of a century had intimate knowledge of the problems involved and the responsibilities assumed by the director, writes a foreword paying tribute to the work carried on with the necessary caution, with courage and with unswerving honesty of purpose by Dr Cramp from 1906 to 1936

HUMAN REACTIONS

Reactions of the Human Machine By John Yerbury Dent (Pp 288 8s 6d net) London V Gollancz 1936

This book is perhaps not of the importance which the publishers and their expert advisers were inclined to attach to it, but it is a very interesting example of an attempt by a thoughtful and well read doctor to co ordinate his reading and experience and to build up and expound some sort of coherent philosophy of human life and behaviour The author describes it as an objective description of such behaviour and a plea especially for the physiological material attitude of patients and doctors towards life and its discomforts and for the exclusion of magic and the supernatural from the treatment of the

NOTES OF THE WEEK

District Nursing in London

The Central Council for District Nursing in London has appointed an executive committee to inquire into the adequacy and efficiency of district nursing in the county of London to report on the question of improving the present arrangements, and to consider the extension of the work beyond the area of the county of London The personnel of the executive committee includes Dr M B Arnold Sir Comyns Berkeley Dr W Paterson, Dr A G G Thompson, and Sir Stanley Woodwark

Dorset Public Medical Service

The Dorset Public Medical Service will come into operation at the end of March The benefits of the scheme are available to dependants of insured persons and to other persons within the following income limits

For single persons	£150 per annum
For married persons without children	£200 ,
For married persons with children	£250

It is stated that the majority of general practitioners in the county have expressed their willingness to take part in the scheme

National Advisory Council on Physical Training

The new National Advisory Council on Physical Training held its first meeting last week The council was welcomed by Mr Oliver Stanley, President of the Board of Education, who said that the most urgent matter for the council s consideration was the setting up of local committees throughout the country for on them depended the functioning of the whole scheme There were also technical questions to be considered such as the syllabuses of instruction for adults It was possible that a trained physiologist would be appointed to the staff At the conclusion of the meeting the council appointed three sub committees The Local Organization Subcommittee will consider the policy to be adopted for the establishment of local committees and will make recommendations to the council on their functions the areas they should serve the method of their appointment and the details of their administration The Technical Policy Subcommittee will be concerned with the training and supply of teachers and leaders including the proposed establishment of the new National Physical Training College and with questions relating to the technical and physiological aspects of physical training The Propaganda Subcommittee will recommend means whereby the desire for physical well being can be stimulated and maintained in all sections of the community

B M A Division's Contributions to Charity

The Southport Division of the B M A has good reason to be proud of its efforts on behalf of the Charities Trust Fund In forwarding a cheque for £45 the proceeds of a dance arranged by the ladies of the Division the Charities Secretary remarks that the contributions of the Division during the last nine years amount to £959 and that it is hoped to pass the £1 000 mark next year

---

The Essex Public Assistance Committee has decided to continue for another twelve months the free choice method for domiciliary medical relief in the Great Clacton and Little Holland Chingford and Walthamstow medical relief districts

The Derbyshire County Council has prepared a scheme for a municipal midwifery service

Dr C C Easterbrook of Dumfries has received a presentation from his friends on the occasion of his retirement from the appointment of physician superintendent of the Crichton Royal Institution which he has held for twenty nine years

human mechanism" He stresses the importance of psychological knowledge in medical training and equipment, curiously describing medicine surgery, and psychology as the three main departments of that equipment The trinity so formed—in place of the more usual classification of psychology with anatomy and physiology as one of the essential professional sciences on which the art of medicine must be based and which must constantly permeate its practice—may perhaps be taken as an example of a certain originality or perversity (as you wish) which manifests itself throughout Dr Dent's exposition of his theme This exposition is able, orderly and generally clear The author first gives biological illustrations of the statement that "life is reaction,' and then goes on in successive chapters, to give his own presentation of the evolution and development of reaction of the reaction to external, internal, and 'conversational" environment, of conflicting reactions and of the persistence decrease, inhibition, and therapeutic alteration of reaction He ends with a chapter on hypnosis, to which he attaches much importance

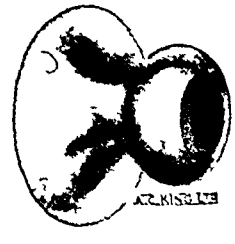
To follow the author's thought and to appreciate his arrangement is a pleasant exercise which will be illuminating to many, and will doubtless carry with it some profit to all but a few The preface invites readers to use the blue pencil Some crudities of belief, some curiosities of deduction, some imperfections of knowledge doubtless may be found in need of such correction or deletion, but to read the book is to realize how interesting and helpful it must have been to write it

Notes on Books

The official *Medical Register* for 1937 has now been published by Constable and Co, Ltd, at 21s, post free 22s 6d It appears from the table printed in the introductory pages that 1 905 names were added last year—twenty-three more than in 1935 New registrations numbered 920 in England, 490 in Scotland 223 in Ireland, and 272 on the Colonial and Foreign lists The total number of names on the *Register* at the end of the year was 59,010, representing an increase of 649 The number of names removed from the *Register* during 1936 was 1,304, compared with 1,057 in the previous year Of these, 1,082 were deleted on evidence of death, 214 for failure to comply with the inquiries of the registrar as to cessation of practice or change of address, and seven were struck off under the disciplinary powers conferred by Parliament on the General Medical Council The average annual number of penal erasures during the past twenty years was five

Books on treatment arranged on an alphabetical plan suggest readiness of reference in an emergency rather than systematic reading and study The *Vade Mecum of Medical Treatment*, by Dr W GORDON SEARS (E Arnold and Co, 10s 6d), falls into this group, and meets fairly well the expectations excited by its title It begins with "Achalasia of the Cardia" and concludes with "Xerostoma," and in the intervening pages most of the conditions met by the practitioner in his daily work receive attention The compilation has been carefully done, and the classical methods of treatment are presented in brief and strictly practical fashion While alternative methods are mentioned, the author not infrequently bases his recommendations on his own immediate experience Nor does the book fail to recognize modern developments, even when these have yet to justify the promises made on their behalf The discussions cannot pretend to be exhaustive or to offer anything very striking or original, but they have their opportunity of usefulness in the field which they profess to serve and the volume deserves a place in the practitioner's library

Two further additions have been made to the Sportsman's Library published at 5s each by Philip Allan *The Shot-Gun* by T D PURDY and Captain J PURDY, is a useful handbook of the gun, there is a chapter on fitting, a detailed one on cartridges and powder and valuable hints are given on the care of the gun *Field Sports of Scotland* by PATRICK CHALMERS is a description of the sport to be had in the Highlands and Lowlands the estuaries and coastal waters of Scotland with the natural history of the roe deer, the caper, black game, and ptarmigan It is well worthy of the attention of sportsmen



A new edition has been received of Professor CARL J WIGGERS *Physiology in Health and Disease* (Kimpton 42s), which was noticed in these columns on its first appearance two years ago Considerable portions of the book have been rewritten new and better illustrations are included the index has been enlarged, and the bibliography modernized

Preparations and Appliances

ORAL PROPS IN GENERAL ANAESTHESIA

Dr A H I BAKER (anaesthetist, West Middlesex County Hospital) writes

The accompanying illustration shows a new oral prop for use in general anaesthesia While incorporating most of the features of existing props this one has been designed with a view particularly to the patient's comfort and to the lessening of oral trauma It is made in three sizes A further modification of this may be lengthened at will so that the inner aperture lies well back over the dorsum of the tongue without undue discomfort however to the patient This is especially useful in edentulous patients who have difficulty in gripping the shorter pattern with the gums and invariably block the inner aperture with the tip of the tongue I would like to express my thanks to Mr Talley of Messrs A Charles King Devonshire Street, W 1, the makers of these props, for much helpful advice in their production

A DUSTING POWDER

"Kinoo powder" (Kinu Ltd, 6, Finsbury Square, E C 2) is a dusting powder made from pure cocoon silk (90 per cent) with 5 per cent boric powder and 5 per cent zinc oxide The use of cosmetics runs back far into pre-history, and that of many of the commoner ingredients such as starch kaolin, and calamine is of like antiquity Modern methods of applied chemistry have provided a very wide choice of powders for such purposes but firmly established traditions have checked enterprise in the employment of new methods The traditional bases are however, unsatisfactory in certain respects—for example, starch when moistened forms a fermenting paste The silk basis of kinoo powder gives a very fine, light and voluminous powder, which has absorbency without producing a paste which is liable to fermentation An independent analytical report confirms the makers' statements regarding the composition of the powder, and shows that it has a very low bacterial content and that no organisms of the *B coli* group are present

STERICREPE BANDAGE

'Stericrepe bandage' is made of a porous elastic material lined with sterilized gauze It is self-adhering and does not stick to skin or hair It is porous seamless grease-proof, waterproof and washable After rolling it off and sprinkling it with ordinary talcum powder it can be used again It can be applied with any desired tension as a support and only a minimum of dressings is required It is supplied both in bandage rolls and finger strips by the makers, at 23, Clarges Street, Piccadilly, W

THE MEDICAL SECRETARY'S VISIT TO INDIA

The following are Dr Anderson's concluding notes The earlier ones appeared in the "Supplement" of February 6 (p 68) and February 27 (p 102)

After a journey of about twelve hours we arrived on the morning of Friday, February 12, at Patna in Bihar Province, where we were met by Lieut.-Colonel G H Mahony, I M S, principal of the Prince of Wales Medical College and professor of obstetrics there I was particularly interested to see the College and its associated hospital of over 500 beds in view of the recognition by the General Medical Council for the first time, in 1935 of the medical degrees granted there The College buildings and the hospital are very conveniently situated, and the wealth of clinical material provides ample opportunities for teaching purposes I was fortunate in meeting the majority of the teaching staff at a tea-party on the first day of my stay in Patna, and well over a hundred medical men and senior students attended a gathering at which I gave an address Lieut.-Colonel Mahony Lieut.-Colonel A N Bose, I M S, professor of pathology, and Major D P Bhargava, I M S, professor of surgery, were instrumental in making the visit extremely enjoyable and interesting

During our stay in Patna I was afforded the chance of seeing the work of the Subdivisional District Hospital at Dinapore and the Rural Dispensary at Khagoul, and it was through the kindness of Colonel P S Mills, I M S, the inspector of civil hospitals in the Province and Major G P F Bowers, I M S, the civil surgeon that I was able to do so As there are considerable numbers of unattached members of the Association in Patna, and indeed in Bihar, and as a desire was freely expressed that a Branch of the Association should be formed in the Province, the first steps have been taken to form a Bihar Branch We left for Benares on Tuesday February 16, having spent a very pleasant four days in Patna, where we experienced the same kindly hospitality which has been accorded us in all parts of India

Benares and Lucknow A Contrast

Two members of the Benares Medical Association Dr Bhola Nath and Dr Ganga Singh, met us on arrival and conducted us to our hotel The same evening I addressed a meeting of the members of the Benares Medical Association, which was held in one of the charitable hospitals in the city Captain S K Chaudhuri the president was in the chair, and a very useful discussion followed my address Part of the next day was devoted to sight-seeing, for which arrangements had been made by Captain Chaudhuri, Dr Bhola Nath, Dr Ganga Singh and Dr Thungamma (a lady doctor) One day is all too short a time to spend in Benares, the centre of Hindu religious life However, through the kindness of our friends we saw a riverside panorama such as no other town in the world affords Shortly after 7 a m, in a boat lent by Captain Chaudhuri, we were rowed along the curve of the north bank of the Ganges and beheld the wonderful array of temples and palaces, with their innumerable stairs ever descending to the water's edge, where massed humanity carries out the daily rite of purifying itself in the sacred river It was a most impressive scene, and one never likely to be forgotten The afternoon was spent in a visit to Sarnath, where Buddha first made known his doctrines to the world, and where some of the most interesting Buddhist ruins have been discovered We parted from the medical profession in Benares at a tea-party in the late afternoon which had been arranged in our honour

Our next stop was the historic city of Lucknow, where we were met on arrival by Lieut Colonel R S Townsend, I M S, president of the United Provinces Branch, Mrs Townsend, and Dr B B Bhatia, the honorary secretary Lucknow the 'city of palaces and parks,' is a decided contrast to Benares The medical college buildings and hospital are in close proximity and make a most picturesque setting, and I was extremely pleased to be able to visit them and to meet many members of the staff Perhaps the best time of the day in which to see the college buildings is towards evening just before the sun begins to set It is then that their beauty stands out in noblest relief the whole structure in perfect harmony with the Mohammedan architecture in the background We were officially welcomed to Lucknow by the members of the Branch at a tea-party given in our honour, and I was also given the opportunity to address a gathering of the medical profession on Saturday afternoon in the Convocation Hall of the college

While in Lucknow I continued my practice of talking with representative members of the profession (one of whom was Dr B N Vyas president of the Indian Medical Association) so as to obtain at first hand their impressions as to the way in which the problem of medical care in this country could best be approached I addressed also a clinical society of students My wife and I spent some time in seeing some of the many historic places in the neighbourhood Our last day in Lucknow was Tuesday February 23 in the evening of which we were entertained to dinner by the members of the Branch Council

Two Busy Days in Poona

During our five days' stay in the capital of the United Provinces much kindness and hospitality was extended to us We left Lucknow on Wednesday morning February 24 reaching Bombay twenty-four hours later The same evening we departed for Poona the last place we were to visit before returning again to Bombay We were met on arrival by Major-General D S Skelton, Khan Bahadur Dr E S Barucha, president of the Poona Branch of the Indian Medical Association and chairman of the Reception Committee, Dr A J Noronha president of the Poona Medical Society Rai Bahadur Dr V B Gibbah retired civil surgeon, Dr N L Ranade vice-president of the Poona Branch of the Indian Medical Association Dr P L Dishmukh and Dr C G Dharap, secretaries Poona Medical Society and Dr V R Dhamdhere, secretary Poona Branch, Indian Medical Association, and secretary of the Reception Committee A programme had been arranged which kept me busy during the two days spent in Poona In company with Dr Barucha I visited the K E M Hospital for women and children, and was shown round this institution by the lady medical superintendent Dr Vakil I was then conducted over the Byram Jeejeebhoy Medical School and the Sassoon Hospitals by the civil surgeon, and the Connaught Military Hospital by Major General Skelton The latter may well be called the Millbank of India A meeting of medical practitioners was held in the Tata Hall of the Poona Seva Sedan's new nurses' quarters, where a very useful and instructive discussion followed an address which I had been asked to give The meeting was well attended

The Reception Committee, which had spared no pains to make my visit enjoyable and educative, arranged that I should see the following important centres of interest

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MARCH 13 1937

ZINC PROTAMINE INSULIN

It is a sure index of the importance of a new therapeutic agent when its introduction is quickly followed by the appearance of modifications for which even more advantages are claimed The protamine insulin of Hagedorn has not waited long for such recognition of its merits The most successful of these modifications appears to be the zinc protamine insulin produced by D A Scott of Toronto, and investigations into the clinical use of this preparation have recently been reported by Rabinowitch and his co workers[1 2] in Canada and by Wilder[3] and by McCullagh[4] in the U S A A paper by Dr R D Lawrence and Dr Nora Archer appeared in the *British Medical Journal* last week (p 487) and a contribution to the subject by Dr H P Himsworth is printed in this issue at page 541 These workers have been content to designate this insulin briefly and clearly either as zinc protamine insulin or protamine zinc insulin but the English manufacturers and the Ministry of Health, intent on attaining a high standard of terminological exactitude, have issued the new preparation under the title of "protamine insulin (with zinc) suspension" It is to be feared that the essential distinction embodied in the parenthesis of this phrase will not survive the rough handling of common usage and if the new preparation is to remain clearly differentiated from the other protamine insulins it would appear desirable that the original and more convenient term of "zinc protamine insulin" be generally adopted

The essential advantage of the original protamine insulin—insulin retard—was that its action was slower and more prolonged than that of ordinary insulin, hence fewer injections were required and a smoother control of the diabetic's metabolism was obtained The reports on zinc protamine insulin indicate that the new preparation has an action which is even slower and more prolonged than that of insulin retard This slow and prolonged action has obvious advantages but also disadvantages, which are clearly demonstrated in the above reports on its clinical use The prolonged action permits reduction in the number of insulin injections With one injection of insulin retard control for twelve or fifteen hours was obtained, with zinc protamine insulin control is achieved for twenty four hours or even longer This makes it possible for that large group of mild diabetics requiring up to a total of 20 to 30 units in divided daily doses of ordinary insulin to be maintained in a satisfactory state of balance by means of one injection of the zinc preparation given before breakfast For reasons that will be explained later, patients with more severe diabetes requiring larger amounts of insulin need in addition a supplementary dose of ordinary insulin but as this can be given at the same time as the injection of zinc protamine insulin the inconvenience thus caused to the patient is negligible

The reduction in the number of daily injections is a convenience to the patient but is in itself no indication that the new preparation has the fundamental property of permitting a more effective control of diabetes That zinc protamine insulin does indeed allow more effective control of the disease than does ordinary insulin is shown by the ability of the new preparation to control the disease during the night It has long been known that in patients with diabetes of any severity hyperglycaemia consequent glycosuria and sometimes ketosis develop spontaneously during sleep Whereas multiple daily doses of ordinary insulin enable control to be maintained in the waking hours, the relatively transient action of ordinary insulin is insufficient to restrain the disease in the long interval between the evening and morning injections Such patients for half the twenty four hours are virtually cases of untreated diabetes By means of zinc protamine insulin these cases can be completely controlled The injection of an appropriate dose before breakfast is enough to ensure control of the disease throughout the following night The prolonged action also enables a continuous rather than an intermittent restraint to be maintained during the day Although the slow action of the new preparation is not so effective as the rapid action of ordinary insulin in suppressing the morbidly exaggerated hyperglycaemia following meals the persistence of the action beyond the times at which ordinary insulin action would have waned results ultimately in a lower post-prandial blood sugar level As a consequence, when zinc protamine insulin is being taken the average blood sugar level during the day is usually a good deal lower than when even larger doses of ordinary insulin are being administered in several injections The slowness with which zinc protamine insulin comes into action militates against sudden reduction of the blood sugar, and as a result against the frequency of hypoglycaemic attacks

the headquarters of the Poona Seva Sadan society, the museum of the Bharat Itihasa Samshodhak Mandal and the headquarters of the Servants of India Society On this sight seeing expedition Dr Bhuchar the doyen of the medical profession in Poona and Dr Dhamdhere accompanied me The programme finished with tea at home on the terrace of the Seva Sadan's Hostels from which a delightful view of Poona is to be obtained This proved to be a most agreeable function and was a fitting termination to a very enjoyable time in Poona

We returned to Bombay on the following day Before we sail for home on Saturday March 6 there will be a meeting of representatives of the various Branches I have been able to visit in order that I may have some idea of the collective views of the profession in India as represented by the Association upon some of the many problems I have been investigating We shall also discuss problems connected with the future organization of the B M A in India The members of the Branch Council have very kindly invited the representatives to be their guests at a dinner at the close of the representative meeting and at this function my wife and I will bid farewell to those who have worked so hard to ensure that every opportunity should be given me to secure the information which it has been my mission to obtain During our journey of ten thousand miles or so round India we stayed at hotels in all the larger centres but on other occasions we availed ourselves of the generous hospitality of the Governor of the Central Province and Lady Hyde Gowan at Nagpur Dr J Cairns C I E at Lahore Lieut Colonel R F D MacGregor I M S at Hyderabad (Deccan) Dr and Mrs D Manson at Cinnamara in Assam Dr G Fraser at Cachar in Assam Lieut Colonel G H and Mrs Mahony at Patna and Major General D S and Mrs Skelton at Poona To all of these and to the many others who invited us to partake of their hospitality we are indeed grateful

I cannot close these notes without making special mention of Dr B B Yodh the honorary secretary of the Bombay Branch on whose shoulders has fallen the difficult task of co ordinating the arrangements which had to be made well in advance of our arrival in Bombay

COMBINED ENGLISH UNIVERSITIES PARLIAMENTARY ELECTION

SIR HENRY BRACKENBURY'S CANDIDATURE

Sir Henry Brackenbury's address to the electors of the Universities of Durham Manchester Liverpool Leeds Sheffield Birmingham Bristol and Reading was printed in last week's JOURNAL *at page 516 We have now received for publication the following manifesto signed by a large number of supporters of his candidature whose names are printed below Polling is from March 15 to 19*

At the by election for one of the two Combined English Universities seats Sir Henry Brackenbury will stand as an Independent candidate accepting the whip of no party Sir Henry Brackenbury first entered public life on account of his interest in educational progress He became a member of the School Board for Hornsey in the year 1899 and has remained a member of bodies concerned with educational administration ever since At that time Hornsey largely under his influence became well known as in the van of educational progress and after the Education Act of 1902 Sir Henry was for ten years the Chairman of the Education Committee of that borough He was for four years the President of the Association of Education Committees of England and Wales and is now a Vice President of that Association and a member of its Executive He has been a member of the Education Committee of the County of Middlesex for more than twenty years and Chairman of the Governing Body of several large secondary schools both for boys and for girls

His activities in municipal life have been extensive He has been a Councillor Alderman and Mayor of his town and Chairman of its principal administrative Committees His interest in questions of public health and social welfare has been well known and widely appreciated in national circles For thirteen years he held the highest offices in the British Medical Association and is now one of its Vice Presidents He is Chairman of the Council of the Institute of Medical Psychology and has been a Vice President and Chairman of the Education Committee of the Central Association for Mental Welfare He is a Member of the Council of the Society of Medical Officers of Health a Fellow of the Chartered Insurance Institute and an Honorary Freeman and Liveryman of the Worshipful Company of Stationers and Newspapermakers He has served on a number of Departmental and Interdepartmental Committees dealing with health and education He is a member of the Court of Governors of the London School of Hygiene and Tropical Medicine and of the British Post Graduate Medical School and a direct representative of the medical profession on the General Medical Council

While it is not to be expected that all Sir Henry Brackenbury's supporters will be in complete agreement with him on every detailed question affecting health and education we consider that it is of considerable public importance that the House of Commons should include members with qualifications such as his independent of party and enjoying the confidence of representative members of all parties We believe that it is the particular function of university representation to afford an opportunity for the election to Parliament of independent candidates with such special knowledge and experience as he possesses

We believe that on questions affecting health and education Sir Henry Brackenbury is exceptionally well equipped to make a valuable contribution to Parliamentary deliberation and we hope that you will cast your vote for him

It would be expected that for the same reason patients taking the new insulin would be less liable to the hypoglycaemic attacks which can be induced by exercise On this point there is some disagreement Himsworth states that attacks from this cause are less frequent, and indeed goes so far as to advocate the use of zinc protamine insulin for those patients who, when taking ordinary insulin, are unusually sensitive to the effect of exercise Lawrence and Archer fear that under the new treatment hypoglycaemia will be produced more easily by exercise, but admit that this has not been the experience of their patients who have to lead energetic lives Wilder, from his experience, forms the opinion that hypoglycaemia during the night may result from excessive exercise during the day It is probable that experience will show that although the familiar hypoglycaemic attacks which supervene shortly after or during exercise when the patient is taking ordinary insulin do not occur when zinc protamine insulin is being administered, hypoglycaemic attacks several hours after the provoking exercise will become common If this is so the taking of an extra carbohydrate meal at the appropriate time will prevent any untoward effect

The very properties to which the clinical advantage of zinc protamine insulin can be attributed are also responsible for its disadvantages The slowness with which it comes into action prevents in all but mild cases adequate restraint of the alimentary hyperglycaemia resulting from meals The injection being given before breakfast, the intensity of insulin action is naturally weakest when breakfast is taken, but becomes progressively stronger as the day goes on For this reason, in moderately severe cases hyperglycaemia and glycosuria will occur after breakfast and to a progressively less extent after the succeeding meals In the relatively rare severe cases gross hyperglycaemia and glycosuria appear after every meal In explanation of this Lawrence and Archer suggest that small doses of zinc protamine insulin come into action more rapidly than large doses On the face of it this explanation seems improbable, and it is controverted by experiments recorded in Rabinowitch's paper A more probable hypothesis would appear to be that post-prandial hyperglycaemias in moderately severe cases, which need relatively small doses of zinc protamine insulin, require less intensive insulin action for their suppression than do similar rises in severe diabetics who need large doses

In patients with moderately severe diabetes in whom marked hyperglycaemia appears only after breakfast, adequate control can be obtained by injecting, simultaneously with the zinc protamine insulin, a small dose of ordinary insulin This, exerting its action rapidly, deals with the influx of sugar from the gut but its action wanes by the time that the zinc protamine insulin is coming into full action and becoming capable of dealing with later meals In the severe cases this method, while enabling restraint to be exerted over the post breakfast hyperglycaemia is insufficient to suppress the alimentary glycosuria brought about by the later meals Wilder and Himsworth claim to have established control in such patients by injecting simultaneously with the zinc protamine insulin, not ordinary insulin but a moderately slow acting insulin such as insulin retard

The great drawback of the new insulin is the type of hypoglycaemic attacks to which it gives rise Though it is true that the slower action results in fewer such attacks than happen with ordinary insulin, it is also true that the attacks which do occur are of unusual severity Two factors contribute to this The fall of blood sugar induced is so gentle that the early warning symptoms of hypoglycaemia are not evoked, and the first evidence of an attack may be convulsions or loss of consciousness The attack having begun the prolonged action of the new insulin holds the blood sugar down at hypoglycaemic levels, thus preventing spontaneous recovery and militating against attempts to raise and maintain the blood sugar at normal levels Himsworth and Wilder stress particularly the severity of these attacks Wilder goes so far as to advise that when a patient is taking zinc protamine insulin he should never sleep alone, and he quotes the remark of one of his patients "I don't have diabetes any more, I have insulin reactions" Realization of the gravity of such attacks has led to insistence upon two rules First, it is insisted that at the beginning of treatment with zinc protamine insulin the patient must be in hospital or under such conditions that he can be closely observed, secondly, that attempts to control severe cases completely by one daily injection of the new insulin alone must be abandoned Instead, it is advocated that zinc protamine insulin should be given only in such doses as will prevent glycosuria during the following night, and that any escape from control during the day should be dealt with by the easily controlled ordinary insulin

The clinical experiences recorded in these papers are in remarkable agreement, and establish clearly that zinc protamine insulin is a more effective therapeutic weapon than ordinary insulin All the investigators recognize the same advantages, but the Canadian workers do not emphasize the dangers of the severe hypoglycaemic attacks which are likely to limit the use of the new preparation in ordinary medical practice

MEDICINE STAMP DUTIES

PROPOSED SIMPLIFICATION AND EXTENSION

A Select Committee of the House of Commons was appointed in November last to consider the duties of excise chargeable on medicines under the Stamp Acts of more than a hundred years ago and has just issued its report (H M Stationery Office 3d net) Its conclusions are that the Stamp Acts are out of date and inappropriate that wholesale avoidance of duty has been practised that the law should be simplified and anomalies removed that 'in spite of some evidence to the contrary the trade in medicinal articles is suitable for taxation but that the rate of duty should be lowered and more evenly graded and that a far larger range of preparations should be made dutiable

History of Stamp Duty Law

Duties on medicines were first imposed by the Budget of 1783, but the present practice is based on the Medicines Stamp Act, 1812 with its attached schedule, still in force containing the names of 550 preparations liable to duty—'pills powders lozenges tinctures potions, cordials electuaries, plaisters unguents salves ointments drops, lotions oils spirits medicated herbs and waters chemical and officinal preparations —which are secret or proprietary or held out as beneficial for human ailments Three exemptions from duty were allowed one of these is now obsolete but the other two—namely single drugs (drugs sold without admixture of any other ingredient) and "known admitted and approved remedies" —have led to great loss of revenue The scale of duties remained the same for over one hundred years until 1915, when it was doubled An article made to sell at 2d attracts a duty of 3d an article at 1s 1d a duty of 6d The committee thinks the gradations too steep

The Acts have been obscured by judicial decisions, and a number of anomalies have crept in For example, salines escape duty though held out as medicines A preparation which is liable to duty when "it is recommended by the use of an ailment name (for example backache pills) is free from liability when reference is

THE FACTORIES BILL AN ADVISORY BOARD?

The days when the law in its formulation and interpretation was based for long periods on fairly fixed principles of human conduct and environment have gone Modern applied science causes conditions to change more quickly than Parliament can wisely change its enactments Hence, as was pointed out in a leading article in the *British Medical Journal* of February 27 (p 450), the newer, less democratic, but more flexible technique of rule by Order in Council or Statutory Order becomes not only more common but more necessary Lord Hewart in *The New Despotism*, warns us against the serious implications of this departure from the principle whereby the courts are the final arbiters of appeal against the executive He shows how by this new method which in a totalitarian State is the only source of law, the citizen virtually has no appeal, because the maker of the law, in our case a Secretary of State, can be both formulator and judge of his own actions This is dangerous and needs to be checked The difficulty is to devise means whereby the elasticity of the new methods can be turned to advantage while safeguarding ourselves from the thin end of the wedge of executive tyranny The British people have no liking for the *droit administratif* Graham Wallas and his school of social thinkers showed a way out The advisory board or committee of experts based on the principle of co-option gives at once an additional source of strength to the administrative machinery and a safeguard against oppressive rule Co opted members of committees have shown themselves to be generally among the most valuable members of such bodies The experience of education committees has demonstrated this It is not that they are better men or women but on the whole they are more keen, and this results from their freedom from electoral pressure

Experts are dangerous people unless used properly Their function lies in advising lay bodies composed of intelligent but often uninformed persons The ultimate results achieved in this way are generally excellent The lay bodies, being appointed for their judicial and critical wisdom digest and compare the different aspects of expert advice Apparently more cumbersome in method than the direct contact between executive and appointed adviser, the principle of advisory boards, part lay part expert, has enormous advantages It lends to decisions a comprehensiveness which if they are to find expression in Orders with the force of law is essential We take the opportunity when a new and important measure like the Factories Bill is passing through Parliament to urge that during the committee stage a clause should be inserted directing the Secretary of State to set up such an advisory board to deal with the mass of Statutory Orders which will have to be issued We suggest that a permanent board of about six persons with a judicially minded chairman should be set up by the Minister, the members being representative of employers, of workers, and of Parliament. To this board should be co opted a panel of doctors, industrial administrators, physiologists psychologists, engineers and such others as from time to time may seem desirable The board sitting to discuss certain matters would call in the relevant co opted members, so that when the Orders finally emerged they would be in tune with practical reality, with humane requirements, and with scientific knowledge

The experiment is well worth trying and Parliament could enter a proviso that after, say, a three-year trial the whole method must be reviewed in the light of experience and of the desirability of its extension to other types of legislation For every issue the number of non political co opted members should be so arranged that it is not less than the number of full members The plenary sessions of the board ought to be public If all powers to make Statutory Orders were based on the principles outlined above we feel that much of the sting would have been extracted from the "new despotism" and a notable advance achieved in scientific government

TWINS ON A VEGETABLE DIET

In a recent report[1] D E Lane makes some interesting observations on the effect on the growth of twins of a vegetable diet planned to contain all the requirements suggested by modern scientific studies on nutrition These children are now 7 years old and Dr Joseph Brennemann after examining them on their last birthday, considered their state of nutrition to be excellent the teeth were good and there was no evidence of dental caries The twins had apparently been freer than the average child from infection of any kind The dietetic regime was as follows They were given "vegetable milk" and increasing amounts of orange juice and cod liver oil during early infancy with the gradual addition of wheat barley rice potato legumes and various fruits and vegetables in season At approximately 3 years of age their general condition was so good that it was thought advisable to go on with this type of feeding until their physical state should warrant a change to the conventional mixed diet containing cow s milk This time has apparently not yet arrived and the only change in the diet as the children have grown older has been that many of the foods

[1] *Amer J Dis Child* 19 6 52 1397

made only to an organ or part of the body Although the original intention was to tax the quack and exempt the apothecary, the committee considers that all dutiable remedies should be sold on equal terms by chemists and non chemists The registered chemist already has certain advantages under modern legislation

Recommendations

The committee recommends the repeal of the Act of 1812 and the associated Acts, and the making dutiable subject to certain exemptions of

'preparations or substances of any sort including medicines medicaments medicated articles drugs herbs fumigants inhalants disinfectants antiseptics soaps tooth pastes tooth powders mouth washes medicated wines natural or artificial mineral waters or compositions for making such waters confectionery toilet preparations and cosmetics to be used or applied externally internally or otherwise as medicines or medicaments, which are recommended for the prevention cure or relief of any human ailment

Exemptions should be granted to all the medicines mentioned when recommended and sold exclusively to registered members of the medical and dental professions, *and to all preparations supplied to such practitioners* for use in the discharge of their professional duties or to registered pharmacists or practitioners for use in dispensing *on the prescription of such practitioners* Medicines exported abroad should also be free as should all British spa waters consumed at their place of origin The recommended scale of duty is for an article whose retail price exclusive of duty would be sixpence one penny with an additional penny for every further sixpence or part thereof, or an *ad valorem* duty of twopence in the shilling Medicines whose retail price is below sixpence should also be subject to a graduated duty of a penny or a fraction thereof

The Select Committee also urges consideration of the propriety of taxing foods and certain appliances (such as deaf aids) beverages (alcoholic and otherwise), and other widely advertised preparations put forward as possessing properties beneficial for health

Control of the Trade in Medicines

Strong opinions were expressed to the committee by certain witnesses that some form of control of the medicine trade was desirable to safeguard the public from fraudulent exploitation Statements were made that people largely of the poorer classes spent more money than they could afford on remedies of little or no efficacy resulting indirectly in danger to health following upon delay in seeking medical or surgical treatment The committee believes that if control of the trade in medicines and appliances is deemed desirable for the protection of the public the best method would be a system of examination and registration of all advertised medicines and appliances

The yield of the medicine stamp duty has fallen since 1928–9, when it was almost £1¼ million to below £750 000 owing very largely to the use of legal methods in securing exemption But during this same period the number of excise licences has doubled suggesting that the trade in dutiable preparations is a valuable one On a conservative estimate the annual turnover of the proprietary medicine trade reaches the figure of £20 millions A duty of twopence in the shilling in the event of the abolition of many existing exemptions would yield £3 300 000 The addition which the committee suggests of articles other than proprietary medicines would, of course, add substantially to the yield

CONFERENCE OF PROVIDENT ASSOCIATIONS

NATIONAL FEDERATION TO BE FORMED

A conference of representatives of provident associations was held at the British Medical Association House on March 4 Dr PETER MACDONALD chairman of the Hospitals Committee of the Association, presiding It was attended by representatives of the British Provident Association the British Hospitals Association the Hospital Saving Association and local associations in different parts of the country, including Birmingham Wolverhampton Sheffield Sunderland and Merseyside The British Medical Association was represented by Professor A H Burgess Sir Henry Brackenbury, and Dr J C Matthews in addition to the chairman

A previous conference a year ago affirmed the desirability of establishing a permanent central co ordinating body of provident associations in place of the existing Advisory Committee on Provident Schemes and appointed an interim committee of ten members to prepare a draft scheme This interim committee held two meetings during the year under Dr Peter Macdonald's chairmanship and completed its reference submitting for the consideration of the conference a memorandum on the constitution of a National Federation of Provident Associations

Objects of the Federation

The main business of the conference was a detailed examination of this draft scheme The objects of the federation were given as (1) the co ordination of the activities *of the federated associations* and (2) the provision of advice and information on the subject Its membership may consist of associations whose objects are in general conformity with the model scheme approved by a previous conference in 1934 and by the Annual Representative Meeting of that year A basis was put forward in the scheme for entitlement to representation at general meetings of the federation—namely one representative for a subscribing membership up to 2 000 a second representative for a subscribing membership up to 5 000 and a representative for each further 3 000 members provided that the total representation of any one federated association shall not exceed six The British Medical Association the British Hospitals Association and the British Hospitals Contributory Schemes Association are to be regarded as associated organizations and each to be entitled to send two representatives

Election of Officers

The subscription basis for the federation led to some discussion but ultimately it was agreed that each constituent association should pay two guineas for its first thousand subscribing members or part thereof and two guineas for each additional thousand or part thereof the associated organizations—that is the British Medical Association and others—to pay a minimum of two guineas It was agreed that the federation should at its annual general meetings elect honorary officers as follows a president vice presidents chairman of executive council honorary treasurer and honorary secretary also an executive council consisting of nine members selected from nominees of the federated associations together with the chairman honorary secretary and honorary treasurer It was also agreed that the British Medical Association should be entitled to two members on the council and each of the other associated organizations to one member The remainder of the draft scheme, which was agreed to dealt

are now served in a more solid form Bread made with the "vegetable milk" was given at an early age, and this contained dried fruits and whole almonds Much care has been taken over the vegetable milk, which in its improved form is known as "almond-lac" It is prepared from a fine preparation of almond meal with corn starch, dextrin, and maltose Dehydrated leafy vegetables supply the mineral content of the milk, and as now prepared "almond-lac" can be used in place of cow's milk Its content of the vitamin B complex is high, and it also contains appreciable amounts of vitamins A and C Careful study of calcium storage shows that with this milk and other vegetable foods entirely satisfactory results have been obtained, and this is reflected in the normal state of dentition The object has been not only to study the growth of the twins but also to demonstrate that "almond-lac" can safely be taken over long periods without any harm to health, for it has been found of great value in children with infantile eczema due to hypersensitivity to other food substances If one twin had been brought up on this strictly vegetable diet and the other in the more orthodox manner the value of the experiment would have been much greater It is evident that such care has been taken of the twins that good results might have been expected with almost any diet

A STUDY OF ONE THOUSAND PLACENTAS

The histopathology of the placenta has attracted no little attention in recent years, and there are those who claim that maternal syphilis and the late toxaemias of pregnancy cause specific changes in this organ Much of the confusion surrounding this subject is attributable to the fact that writers interested in one problem devote their attention to placentas from women manifesting certain symptoms during pregnancy and pay insufficient regard to the wide ranges of variation in normal cases W B Haver[1] has made a careful study of one thousand consecutive placentas obtained from white women He concludes that placental infarcts may be divided into two groups foetal and maternal In the early stages of placental formation the trophoblast is invasive and the syncytial cells do not cause the blood to clot Later the enzyme action is lost and degeneration occurs in the syncytial cells, so that they no longer inhibit, but actually cause, the deposition of fibrin Similarly the decidua undergoes degenerative changes with the formation of red infarcts, which in time become white Although the incidence of these infarcts was higher in the group of women suffering from the late toxaemias of pregnancy some 30 per cent of the placentas from this group "were as nearly normal as are usually found at term" Moreover, the placentas from women suffering from pre-eclamptic toxaemia which showed marked infarct formation merely evinced pathological changes "exactly similar to, but more extensive than, those seen in the average normal cases," although equally marked changes were found in placentas from women who manifested no symptoms and gave birth to living children It was therefore concluded that infarct formation is evidence only of senility in the organ and that the factors associated with pre eclampsia tended to hasten these changes The author was unable to diagnose syphilis from the gross or histological study of the placenta He observed the condition of placentosis described by Goodall in 226 placentas, and formed the opinion that the condition is due to passive congestion of the placenta, which is, as a rule, of no clinical significance The interesting problem remains What are the factors which cause infarction in approximately 50 per cent of all placentas, or, conversely what are the factors which resist their formation?

RADIOLOGY AND ITS RELATION TO MEDICINE

Radiology is a rapidly expanding subject, both in the details of conditions already susceptible to x-ray investigation and in new fields The increasing complexity of radiological work presents a problem to him who undertakes it because of the diversity of specialized knowledge he should in theory possess He must be acquainted not only with radiological interpretation but with the various departments of medicine and surgery which seek his help in diagnosis and therapy It is obviously impossible for any one person to achieve expert status in all these branches, but the nearer the radiologist approximates to that ideal the greater his value to his colleagues It has been suggested that he should be content to enumerate in his report the radiographic and fluoroscopic departures from the normal appearances, without indicating their diagnostic significance This does not help matters greatly, since someone must correlate the radiological with the other evidence, and for this the radiologist's experience possibly equips him better than the clinician The difficulty should primarily be met by co-operation and consultation between the radiologist and the clinician It is a commonplace how often a doubtful x-ray diagnosis is made definite by some point in the clinical aspect of the case, and such doubts can only be cleared up by personal consultation More information will be obtained from x-ray examinations in this way than if the two work in water-tight compartments To make such co-operation fruitful the radiologist should widen his knowledge as much as possible in general medicine and surgery, in the special branches, and in pathology The last, being the basis of so many of the changes seen in a radiograph, is of particular importance, and is emphasized in a recent article by K Kornblum and H J Tumen[1] That radiologists as a whole are alive to these problems is indicated by the fact that at the International Congress of Radiology to be held in Chicago this year the main subject is the unity of medicine and surgery in its relation to radiology This is a matter which has fully occupied the attention of radiologists in this country In 1934 the British Association of Radiologists was founded "to promote the interests of radiologists in relation to medicine with special reference to the following aspects (1) clinical, (2) educational, (3) ethical, (4) economic" In

with the functions of the executive council, the arrangements for general meetings, the acceptance and termination of membership, and the alteration or amendment of the constitution

Eligibility

The principal discussion in a most amicable conference concerned the rules governing the eligibility of associations for membership of the federation It was acknowledged to be very difficult at the present juncture, when the whole matter is in its early formative stage, to lay down absolute rules governing inclusion and exclusion A little interchange of conversation among those present showed how widely different are the associations already in existence, being governed largely by the circumstances of their area

It was generally agreed that eligibility for admission should be dependent upon general conformity with the model scheme, whether the provident association be organized on a "full cover" or "grant-in-aid" basis This would mean that even though the scheme in an area might not at present be on all fours with the model scheme, in expression of general adhesion to the model is the ideal and objective would be taken to justify inclusion at the present stage A request was made for a definition of the phrase 'general conformity,' but no one appeared to be prepared to give it The only line of exclusion which was drawn was that a scheme which did not make any contribution direct or indirect for medical services could hardly be described as a provident association in the sense of the memorandum

It was left to the Interim Committee already appointed to issue invitations to provident associations to join the federation subject to a declaration of general conformity with the model scheme It was reported to the conference that the British Medical Association had agreed on the request of the Interim Committee to place at the disposal of that committee for the purpose of any expenses preliminary to the formation of the National Federation of Provident Associations a sum of up to £100 on condition that such sum would be refunded by the federation as funds were available A warm vote of thanks was accorded to the British Medical Association for its generous action on the motion of Mr T W Place of the Birmingham Hospitals Contributory Association, and was seconded by several representatives

PUBLIC HEALTH NOTES

Factory Legislation

There have been three distinct periods in the history of factory legislation In the first period which was roughly the first half of the last century, legislation was the result of concern about *industrial fatigue* A *Factories Inquiry* Commission disclosed excessively long hours of work and its recommendations were incorporated in the 1833 Factory Act which fixed twelve as the maximum number of working hours for persons under 18 and forbade the employment of children under 9 An improvement followed on the passing of the Ten Hours Act in 1847 in which the hours of labour of women and children in textile factories was limited to ten

In the second period, lasting from 1850 to 1870, the concern was mainly over the toll of life and danger to limb arising from accidents by machinery Legislation followed, and the enactments later consolidated in the Factory Act of 1878, by which time the beneficial results from the operation of hygienic principles in factory labour were realized From 1870 onwards attention was concentrated more on industrial diseases A number of Acts were passed containing provisions which were designed to control dangerous trades and to secure early knowledge of certain occupational diseases by placing on medical practitioners and on employers the obligation of notifying diseases

With a few amendments and extensions the Factory and Workshops Act of 1901, in which factory legislation was consolidated, has been the main factory code In this measure three places of work were mentioned factories, workshops, and workplaces In general the term "factories" included all places in which mechanical power was used in aid of the manufacturing process and also those places whether mechanical power was used or not, in which certain specific industries were carried on Workshops in general were those places, not being factories, in which manual labour was exercised by way of trade or for purposes of gain in making altering etc any article, and to or over which the employer of the persons working there had the right of access or control A workplace was not defined but has been construed as being any place where work is done permanently and where people assemble together to do work permanently of some kind or other

Places of employment are under the control of the Home Office, and since the appointment of the first factory inspectors in 1833 their supervision has been except to a limited degree, dissociated from the jurisdiction of the local sanitary authorities and their health officers The responsibility of the local sanitary authorities in the case of factories has been limited to ensuring the provision of satisfactory means of escape in the event of fire the provision of suitable and sufficient sanitary conveniences, and some special duties as regards bakehouses and domestic factories District councils had somewhat more extended duties in regard to workshops and workplaces—namely, to supervise their sanitary condition, to see that provision was made for means of escape from fire in the case of workshops to enforce special sanitary regulations for bakehouses and to control conditions of homework The main features regarding sanitation were the supervision of cleanliness the ensuring of sufficient air space and ventilation the securing of satisfactory drainage of floors and the provision of sufficient sanitary accommodation The objects of the provisions relating to home work were to ensure that such work should not be carried out in places injurious or dangerous to the health of the persons working there and to prevent the risk of spread of infection through articles being dealt with in premises in which any inmate was suffering from an infectious complaint

The general inspection and supervision of factories is undertaken by an official of the Home Office, the factory inspector Another official of this department is the certifying factory surgeon whose duties include those of examining, at the request of the employer, young persons under 16 as to fitness for employment in factories and workshops reporting on certain accidents and certain cases of poisoning examining persons employed in specified dangerous processes and making special inquiries, examinations and reports when required of the Secretary of State

The Factory Bills promoted in 1924 and 1926 failed to reach the Statute Book From the Bill now before the House of Commons it is hoped an Act will emerge which will simplify and consolidate the existing Acts Regulations and Orders A summary of the provisions of the Bill which

1936 the council of this body approved the establishment of a Fellowship of the British Association of Radiologists to meet the need for a higher radiological qualification Those who have framed the regulations for the Fellowship examination hold that radiologists should have a wide knowledge of clinical medicine of pathology and of certain aspects of general surgery if they are to make the fullest use of their specialty They have therefore appointed among their examiners a physician a surgeon and a pathologist The first examination for the Fellowship will be held on November 29 of this year The medical profession will we are sure welcome the step that has been taken to consolidate the educational equipment of the radiologist

THE WORK OF DR CRAMP

The fight against quackery that has been conducted for thirty years and more by the American Medical Association is well known in this country and its value is appreciated not only by the medical profession but by all who are interested in the combating of commercial fraud In particular many of our readers will be familiar with the two interesting and racy volumes entitled *Nostrums and Quackery* that appeared in 1911 and 1921 A third volume of the same quality entitled *Nostrums and Quackery and Pseudo Medicine* is noticed on another page but our pleasure in welcoming it is qualified by the regret with which we learn that the author Dr Arthur J Cramp has been compelled by ill health to relinquish further work on these lines All three volumes have been compiled by Dr Cramp who for thirty years has led this struggle against heartless fraud This is a fine record of courageous persistence in public service The persistence is all the more remarkable because the struggle is endless Disease and suffering beget credulity and wherever credulity exists knaves will be found ready for its exploitation It might be thought that an ordinary sense of human decency would act as a check on the exploitation of human misery but experience teaches otherwise and indeed in no other field of commerce do we encounter such impudent fraud as in the sale of quack medicines Whenever a fraud is exposed half a dozen new ones spring up to take its place but Dr Cramp has never been disheartened by the unending nature of the task to which he devoted his life In his introduction to the new volume he points out that the quack trades on human ignorance more than on human stupidity and that credulity can only be remedied by a spread of knowledge He expresses the hope that a Utopian period may arrive when it will be as legally dangerous to falsify in any medical advertising as it is under present law to make false or fraudulent statements on or in the trade package We are as far away from this moderate ideal in this country as our colleagues are in the United States but if any advance is made Dr Cramp will have the satisfaction of knowing that he has done more to prepare the way than any other man The quack nostrum trade is international in its activities, and the British medical profession owes a great debt to Dr Cramp for providing it with the information necessary for combating both home produced and imported frauds We can only state our thanks and express the hope that he will enjoy the leisure he has earned by his many years of strenuous combat

VOLKMANN'S CONTRACTURE

Ever since 1881 when Richard von Volkmann of Leipzig first described this condition there has been a good deal of speculation about its precise nature It has been regarded by some as an ischaemic myositis or an ischaemic muscular atrophy and more recently by Leriche as an arterial infarction with necrosis and venous stasis and exudation followed by a slow sclerosis resulting from the initial vascular lesion It is well known that Volkmann's contracture has a rapid onset most often results from injuries in the region of the elbow which are treated by flexion at this joint and follows treatment by too acute flexion or by tight splints bandages or casts which interfere with the circulation in the forearm Pain is usually intense and should be the signal for early diagnosis it cannot be insisted upon too forcibly that a fracture in the course of treatment should not be painful and that if pain is present its cause must be sought In all cases of fracture of the elbow a careful watch should be kept upon the digital circulation as any signs of its impairment call for investigation In addition to the removal of tight splints and bandages and the relief of flexion compression further decompression of the forearm vessels can be brought about by dividing and opening up the deep fascia (aponeurotomy) In a recent paper on the pathology of Volkmann's contracture MM L Tavernier J Dechaume and F Pouzet[1] give details of three cases in children aged 8 10, and 5 years From careful histological studies of pieces of forearm musculature taken during aponeurotomy they agree with Leriche that muscle infarction is the primary factor and that interstitial exudation with further vascular obstruction and anoxaemia are contributory ones The contracture is not the inevitable result of this process but comes about gradually as sclerosis occurs in the affected muscle fibres "La griffe n est pas une sequelle definitive mais un processus pathologique en constante evolution" This study not only throws more light upon the nature of Volkmann's syndrome but emphasizes the importance of early decompression

The one hundred and first annual general meeting of the Royal Medical Benevolent Fund will be held in the library of the Medical Society of London 11 Chandos Street Cavendish Square, W on Tuesday March 16 at 5 p m with the president Sir Thomas Barlow in the chair

A widely supported manifesto in favour of Sir Henry Brackenbury's candidature for the forthcoming Combined English Universities Parliamentary election will be found in this week's *Supplement* at page 127 Polling is from March 15 to 19

[1] *J Med Lyon* December 20 1936 p 815

was introduced in the House of Commons on January 30, and which is now being examined by a Standing Committee appeared in the *Journal* for February 13 (p 367) and a report of the second reading on February 27 (p 477) It is proposed that the Bill shall come into force on July 1, 1938 but with powers given to the Secretary of State to postpone to January 1 1940, the operation of any particular provision of Part II The debate on the second reading revealed a considerable measure of agreement between all parties The opposition was directed more to what was omitted than to what was included the chief criticisms being that the Bill avoided the larger issues demanding attention such as the necessity for a forty hour week limitation of working hours abolition or curtailment of overtime and provision of holidays with pay In reply to these criticisms it was pointed out that factory legislation had never been extended to include measures such as the extension of leisure beyond the minimum necessary for health and safety and that these further considerations were more the concern of the Minister of Labour A number of criticisms were passed on the proposal to class together women and young persons, it being contended that in no circumstances should young persons be permitted to work overtime and that the number of hours of work should be more restricted In spite of the criticisms levelled against the Bill it passed the second stage without a division

Notification of Ophthalmia Neonatorum

Under the Public Health (Ophthalmia Neonatorum) Regulations 1914 it was obligatory on a midwife to notify to the local medical officer of health any case in which she had reasonable grounds for supposing that a child upon whom she was in attendance was suffering from ophthalmia neonatorum unless notification had already been made by a medical practitioner This divided responsibility resulted in instances of complete failure to notify so by the Regulations of 1926 the duty was placed solely on the medical practitioner in charge of the case, though the midwife by the rules of the Central Midwives Board still had to notify the local supervising authority

The notification by the medical practitioner was required to be sent to the medical officer of health of the district within which the place of residence of the parent or other person having charge of the child was situate at the time The 1928 Regulations introduced an amendment whereby the practitioner was required to notify the case to the medical officer of health of the district within which he is attending such child ' instead of within which the place of residence of the parent or other person having charge of the child is situate Notification of cases occurring in hospitals in London however had to be sent to the medical officer of health of the district in which the mother of the patient was residing when the child was brought to the hospital By the 1926 Regulations it became obligatory on the medical officer of health of the local authority to forward a copy of every notification received by him to the medical officer of the administrative county within which the district is situate

With regard to treatment the circulars accompanying the regulations expressed the view that the appropriate authorities were those carrying out maternity and child welfare schemes In the case of those sanitary authorities responsible for the maternity and child welfare services in their areas there is no delay in taking the necessary steps following the receipt of notification of a case of ophthalmia neonatorum The position is different however in those districts in which the county council maintains the child welfare services since the county medical officer will not ordinarily receive intimation of the occurrence of a case until twenty four hours after the facts are known to the local medical officer of health To remedy this position the Public Health (Ophthalmia Neonatorum) Amendment Regulations 1937, have been framed and will come into operation on April 1 next from which date notification of cases of ophthalmia neonatorum must be sent by the practitioner to the medical officer of health of the local authority of the administrative area within which the medical practitioner is attending such child at *the date of notification*'—'*administrative area*' being defined as the area in respect of which the local authority is the responsible one for the purposes of the Notification

Public Health Appointments

The following changes have recently taken place in public health service medical staffs

Dr S F Allison medical officer of health for Lowestoft to be medical officer of health for Warrington

Dr Sarah Harris deputy medical officer of health for Keighley to be deputy medical officer of health and assistant school medical officer for Maidstone

Dr G Ramage assistant medical officer for Holland Lincolnshire to be *senior assistant medical officer of health* and clinical tuberculosis officer for Stockport

Dr G S Robertson deputy medical superintendent of Calderstones Certified Institution Whalley has been appointed medical superintendent of the institution in succession to Dr F A Gill who is retiring

Dr J M Thomas assistant medical officer of health for Barking to be deputy medical officer of health and school medical officer for the same authority

Dr J V Walker to be assistant medical officer of health and assistant school medical officer for Croydon

Dr J M Watt medical officer of health for Shipley to be medical officer of health for Rotherham

---

The death is announced of Dr W D Wiggins medical superintendent of St Alfege's Hospital Greenwich

---

INSURANCE MEDICAL SERVICE WEEK BY WEEK

Patient's Right to Change His Doctor

One of the most difficult problems that has arisen from time to time in the administration of medical benefit has been the question of how far the patient's free choice of doctor—which is inherent in the insurance scheme—should be restricted after he has made his first choice in the district in which he has come to reside It will be remembered that originally transfers could only be effected at the end of each year but the 1920 Regulations provided for transfer at half yearly intervals By the 1924 Regulations a drastic change was made and patients were given a right to change their doctor at any time This was done because it seemed to be the only effective way in which the principle of free choice of doctor could be adequately observed A few years experience however led to the present arrangement which was introduced in 1931 whereby the right to change at any time is conditional upon the consent of both doctors The normal method is however a transfer at the end of a quarter upon one month's notice being given This means that if for example the patient who is dissatisfied with his doctor has not given notice by the end of February of his desire to be transferred at the end of March he must remain on the doctor's list until the end of June

It may be assumed that as so many alternatives have been tried the present compromise is on the whole the

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE PHYSIOLOGY OF THE ENDOMETRIUM AND UTERINE MUSCLE, AND OF THE OVARIAN CYCLE

BY

J. M. ROBSON, M.D., D.Sc.

(Concluded from page 514)

The Genesis of Menstruation

The alterations in the secondary sex organs occurring during the various phases of the sex cycle are under the control of the hormones secreted by the ovaries. The changes in the ovary, as has already been explained in a previous article (*Journal* March 6, p. 512), are in their turn controlled by hormones produced in the anterior lobe of the pituitary gland, the pituitary hormones have, however, no direct effect on the uterus or on other secondary sex organs.

The general scheme of the alterations in the uterus—follicular phase–ovulation–luteal phase leading to menstruation—has already been described. This scheme is based on numerous investigations and observations on the state of the uterus and the ovaries in primates, including the human subject, at various stages of the menstrual cycle. There is also ample evidence that the two chief phases of the cycle—the follicular and the luteal phases—are controlled essentially by the two ovarian hormones oestradiol and progesterone. Indeed, the conditions of the uterus in the follicular and luteal stages have been reproduced on numerous occasions by hormone injections in ovariectomized women and in monkeys. Administration of large doses of oestrin will produce a proliferated endometrium similar to that present at the end of the follicular stage of the menstrual cycle. If such a period of oestrin injections is followed by the administration of suitable doses of progesterone then a secretory endometrium typical of the luteal phase of the menstrual cycle is produced.

Equivalent conditions of the uterine endometrium can also be obtained in the lower animals. The exhibition of oestrin brings about a state of the uterus similar to that seen at oestrus, and injection of progesterone after a period of oestrin administration causes a state of the uterus similar to that seen during the normal luteal stage of the sex cycle. Indeed, the typical endometrial condition thus produced in the rabbit (progestational proliferation) is used extensively for the standardization of preparations of the corpus luteum hormone, though synthetic preparations of the hormone are now becoming available, the dosage of which does not depend on animal standardization, as a definite weight can be given.

Oestrin Production and Menstruation

The interrelations of oestrin and progestin in their action on the uterus require some consideration. The typical effects of progesterone on the uterine endometrium and muscle are only seen when these structures have been previously under the influence of oestrin. This latter substance *therefore prepares the uterus for* the action of the luteal hormone. This is, of course, what occurs in the menstrual cycle, in which the luteal follows the follicular phase. Oestrin, however, is also produced during the luteal phase of the cycle, and acts then synergistically with progesterone in controlling the uterine changes. Indeed, examinations of the hormone content of the blood and urine during the various phases of the menstrual cycle suggest that oestrin production is at a maximum during the later stages of the cycle. Quite large quantities of the hormone are excreted in the urine of primates during both the follicular and the luteal stages, but the excretion of oestrin decreases during menstruation itself.

Peaks of oestrin excretion at ovulation and also later *in the cycle have been described. The hormone content* of the blood is low in the follicular phase but increases gradually and reaches a maximum a few days before the onset of menstruation. Too great a reliance cannot at present be placed on the quantitative data of oestrin production and excretion, as methods of extraction are by no means yet standardized, but the available data nevertheless demonstrate that oestrin may be found during all phases of the menstrual cycle, and suggest that the production is at least as great during the later part of the cycle as at any other time. Furthermore, they show that associated with the onset of menstruation there is a decrease in the oestrin production. Much experimental evidence also supports the view that the menstrual bleeding follows a withdrawal of oestrin. The administration of large doses of oestrin to ovariectomized primates including women is followed by uterine bleeding which occurs as a rule several days after the last injection of the hormone. Occasionally, however, bleeding may take place during the period of administration of oestrin, but it appears likely that this is due to an insufficient dosage of the hormone, and that when adequate amounts of oestrin are given there is no uterine bleeding during administration but only after it.

There has been much discussion about the relative importance of oestradiol and progesterone in the genesis of menstrual bleeding. It has been found experimentally that if an ovariectomized monkey is given oestrin the bleeding which usually follows cessation of the injections can be delayed by the administration of progesterone, and that uterine bleeding then occurs several days after the last injection of the luteal hormone. On the other hand, uterine bleeding during progesterone administration has been demonstrated in a monkey in which the oestrin level was decreased. This suggests that the fall in oestrin level is the essential factor in the genesis of uterine bleeding. In the normal ovular cycle this fall probably takes place about the same time as the luteal activity ceases and leads to bleeding from a secretory endometrium while in the anovular cycle no alteration in luteal activity is involved, and the uterine bleeding following a decrease in oestradiol production occurs from a proliferated endometrium.

During the whole of the menstrual cycle (and during pregnancy) a substance is excreted in the urine of women which has certain properties ascribed to the male hormone. Whether this substance plays a part in the control of *the uterine changes during the menstrual cycle* and during pregnancy is at present unknown.

most satisfactory, and that the change by consent of both doctors is usually sufficient to bring about a separation where the relations of the doctor and the patient have become somewhat strained. The doctor of course can give notice at any time to have a patient removed from his list after fourteen days (or upon the patient's earlier acceptance by another doctor). This right is subject to a condition that a patient who is at the time incapable of work could not ordinarily be removed until he was fit to resume work.

Although the general position may be regarded as perhaps the most satisfactory that can be arranged in a scheme affecting so vast a number of insured persons there is a provision which appeared in earlier Regulations whereby, after an investigation by the Medical Service Subcommittee, the Insurance Committee might make immediate arrangements for the transfer of the complainant to the list of another doctor, and also a wider power that the committee might decide "that they will on the application of any person included in the list of the practitioner made within six months after the date of their decision, make arrangements without further inquiry for the transfer of that person to the list of another practitioner and may inform the insured persons included in his list of their right to be so transferred." These provisions became unnecessary when the insured persons were given an unrestricted right to change their doctor at any time and were omitted from the Regulations. When restrictions on the right to change at any time were again introduced in 1931 the old medical service provision referred to above was not included in the Regulations.

A writer in the *Journal of the Clerks to Insurance Committees* has put forward for consideration the view that the old medical service provision should be reintroduced. In the course of his article he says:

> The clauses giving the committee power after an investigation by the Medical Service Subcommittee to allow the complainant to transfer immediately or to open a list have not been restored to the Regulations and it follows that at the present time the committee has no power even in a case where the doctor is admittedly negligent to expedite the transfer of the insured person concerned in the inquiry. Is it not desirable that the power which was given to Insurance Committees when there was a restriction on transfers and was only taken away presumably because that restriction was removed should be restored now that a restriction on transfers is again in force?
>
> It is submitted that the power to open a list may in some cases, be extremely useful. There may well be cases where the committee hesitates long before taking the extreme step of making representations to the Ministry that the continuance on the medical list of the practitioner would be prejudicial to the efficiency of the medical service of the insured as it is generally recognized that this is likely to have a most serious effect upon the practitioner's professional career. On the other hand it is not difficult to imagine circumstances in which it is desirable to allow insured persons if they wish to do so to select another doctor immediately. The General Medical Council itself recognizes the desirability of having some intermediate penalty which it can impose short of striking a doctor off the *Register* because at almost every meeting held for disciplinary purposes cases come up which obviously cannot be overlooked and in default of any kind of half way remedy the Council adjourns consideration for six months in order to give the doctor an opportunity of re-establishing his reputation. Of course the committee has the power of imposing a fine but this while it marks the committee's view that the doctor's conduct has been unsatisfactory does nothing to help the insured persons who are on his list and may wish to transfer immediately without the waiting period usually imposed.
>
> An even stronger case may be advanced for allowing an individual complainant to transfer immediately. Experience shows that a complaint is not usually made unless there has been a certain amount of friction and while in some cases the investigation by the subcommittee may act as a safety valve for heated feelings in other cases it is impossible altogether to relieve the tension. Even in a case where no blame attaches to the practitioner that confidence which is recognized as an essential feature if the relationship of doctor and patient is to be successful must sometimes be destroyed and no effort on the part of the subcommittee can restore the proper atmosphere. It surely cannot be desirable that the patient should be tied to a doctor in whom he has rightly or wrongly lost confidence for a period of anything up to four months.

As noted in this column recently, there has been a considerable falling off in the number of cases brought before Medical Service Subcommittees, and therefore it is not often that action would have to be taken if the earlier provisions referred to in the above article were reintroduced. The proposal made is at any rate one which merits careful examination.

Delay in Choosing a Doctor on Removal

A communication has been received by the Insurance Acts Committee of the B.M.A. from a South Coast medical practitioner (*a*) drawing attention to the great influx now taking place to the South-East of England from the North and Midlands of families which include insured persons, (*b*) pointing out that a large number of the insured persons concerned are not choosing a doctor in their new area and (*c*) inquiring whether any action can be taken by the Insurance Acts Committee with a view to bringing pressure to bear upon such insured persons to choose a new doctor expeditiously.

The question is only one aspect of a general question, which is really not capable of any exact settlement. A certain number of the insured population who perhaps move rather frequently are always inclined to delay choosing a doctor until they need his services. The present generation of insured persons however, is much better educated than their seniors in the matter of choosing a doctor as a routine procedure on entering insurance and also on removal. It is quite clear in any case, that an attempt to make any adjustment between areas or between the practitioners in an area would involve factors quite impossible of assessment. The present method results in a rough-and-ready measure of equity. Delay on the part of any insured person in getting on to a doctor's list is usually compensated by an equivalent delay after he removes from the area during which time his name remains on the doctor's list. The Insurance Acts Committee is of opinion with regard to the particular representation which has been made that no useful purpose would be served by action on its part.

Correspondence

PARKING OF DOCTORS' CARS

SIR,—In view of the Minister of Transport's recent announcement that he is considering the prevention of the parking of motor cars in public squares and streets certainly in London and possibly in the Provinces through the various local authorities I consider it is important to bring the matter up from the point of view of the medical man. What will be our rights in the matter?

There are many occasions on which one has to leave a car by or night for long periods sometimes for as long as two hours in a street outside a patient's house admittedly sometimes in busy thoroughfares. Is one going to be forced to put the car in a garage or in an official parking place perhaps a long way away, and have to waste an enormous amount of time in a busy day quite apart from the possible urgency of the particular call?

I feel most strongly that as a profession we should definitely and quickly get a ruling on this, and that we should claim

Sterility and Fertility During the Sex Cycle

The alterations in the ovaries and uterus during the menstrual cycle and during the corresponding phases of the sex cycle in the lower animals have now been described, and before going on to an examination of the changes which take place during pregnancy the question of the time in the menstrual cycle at which fertilization and conception can occur will be briefly discussed

Obviously there can be fertilization only after ovulation, and the period during which coitus may lead to conception is therefore determined by three factors (1) the actual time of ovulation during the menstrual cycle (2) the period of time after ovulation during which the ovum can be fertilized, and (3) the period of time during which spermatozoa remain capable of fertilizing the ovum after they are introduced into the female genital tract

Evidence derived from the study of the state of the ovaries and uterine endometrium during various phases of the sex cycle gives a satisfactory answer to the first question It appears probable that in primates, including women, ovulation occurs at about the middle of the menstrual cycle, though the experimental data for monkeys suggest that in exceptional cases it may take place rather earlier or later On the whole the available evidence is strongly in favour of the view that ovulation almost always occurs well within the middle third of the menstrual cycle

No answer based on direct evidence can be given to the second and third questions in so far as the human subject is concerned, but there is good evidence that the periods during which the ovum can be fertilized after ovulation and spermatozoa retain the power of fertilization after coitus are comparatively short in a large number of species investigated It would indeed appear that the ovum can no longer be fertilized even a few hours after its extrusion from the ripe follicle while the spermatozoa in the female genital tract retain their power of fertilization at most for a few days after coitus It seems most unlikely that the behaviour of the ova and spermatozoa in the human subject should be essentially different in this respect from those in the lower animals

The conclusion from these data is that coitus can only lead to conception when the former takes place within the middle third of the menstrual cycle Recent carefully controlled experimental work in monkeys and observations in women are in agreement with this conclusion On the other hand there is much previous evidence which suggests that conception can occur at all times during the menstrual cycle Only carefully controlled clinical work by observers fully cognizant of the physiological factors involved can lead to a definite conclusive answer to the question The general practitioner is in an especially favourable position to obtain such evidence

Changes in the Ovaries and Uterus During Pregnancy

If the ovulated ovum is fertilized and becomes implanted then the phase of activity of the corpus luteum is markedly prolonged and extends over an appreciable part of the ensuing gestation During the development of the implanted ovum an organ for the nutrition of the embryo is formed—the placenta—which then probably takes an important part in the production of hormones during pregnancy

The processes of follicular maturation and ovulation which take place at regular intervals in the non pregnant subject are inhibited during gestation Nevertheless cyclical waves of follicular growth occur, but the follicles do not become mature and do not ovulate, and hence no corpora lutea are formed The duration of activity of the corpora lutea of pregnancy varies in different species Thus in the rabbit they remain active throughout the whole of gestation and their removal is followed by abortion (or absorption of the uterine contents if they are removed early in pregnancy) In the mare the corpora lutea rapidly atrophy after the first third of gestation but their removal at any stage after implantation does not lead to abortion Similarly in the human subject the corpora lutea are probably not active in the later stages of pregnancy, and removal of the ovaries even early in gestation can be followed by a normal pregnancy and parturition It appears likely that in certain species the production of the luteal hormone progesterone is partly taken over by the placenta and that after removal of the ovaries and corpora lutea in these species the vicarious secretory activity of the placenta is sufficient to maintain a normal gestation

During pregnancy in primates the production of the follicular hormone oestradiol markedly increases and large quantities of oestrogenic substances derived from it (oestrone and oestriol) are excreted in the urine As in the second or secretory stage of the menstrual cycle the corpus luteum probably takes part in the production of the follicular hormone during pregnancy, thus secreting both progesterone and oestradiol After removal of the ovaries the production and excretion of oestrogenic substances is continued and it appears likely that the placenta is the source of this hormone too, the vicarious production of oestradiol by the placenta is again sufficient to maintain normal gestation in women in whom the ovaries have been removed It is of great interest that most of the oestradiol produced during pregnancy is rapidly converted into and excreted as inactive compounds (of glycuronic acid), and that only just before and at parturition does this hormone not become inactivated and is therefore excreted as active oestrone and oestriol

There is considerable increase in the size of the uterus during pregnancy necessary to accommodate the developing foetus To some extent this growth is brought about by the large quantities of ovarian hormones produced at that time but other factors, about which little is known, are probably also involved Local distension is certainly one of the factors responsible for the growth of the uterus for it has been shown that some hypertrophy will occur when the distension is brought about experimentally apart from pregnancy

The alterations in the uterine endometrium in the earliest stages of pregnancy are similar to those observed in the secretory stage of the menstrual cycle and are under similar hormonal control—that is progesterone and oestradiol secreted by the ovaries These two hormones are necessary for the formation of the placenta which follows implantation and indeed, a decidual reaction can be elicited experimentally when trauma is applied to the uterus of non pregnant animals subjected to the action of the two ovarian hormones

The alterations in the physiological activity of the uterine muscle during pregnancy have been especially studied in an attempt to elucidate the factors which maintain gestation and in late parturition Quantitative measurements of the reactivity of the muscle to the oxytocic hormone of the posterior pituitary lobe have been made in several species and it has been found that the muscle always attains its maximum reactivity at parturition, when very small doses of oxytocin will bring about its contraction This is true both for the organ *in situ*

special privileges while on professional work It is a matter that could be easily worked if we were entitled to wear some distinctive badge on our cars while on professional work, with covering clauses of heavy penalties for abuse of the use of the badge

I shall be pleased to hear what other practitioners feel on the matter—I am etc,

S F LOGAN DAHNE M A M B B Ch

Caversham, Reading March 5

*** The question of issuing a special badge for doctors motor cars was discussed by the Representative Body of the British Medical Association in 1935 The Representative Body then expressed itself against the institution of any such practice

MEDICAL ADMINISTRATION IN SCOTLAND

SIR—In your leading article of March 6 (p 506) reviewing Sir Arthur Newsholme's latest book you comment on the Report on Scottish Health Services saying that all but two of six (properly seven) medical persons on the committee were disposed to hand over the functions of Scottish Insurance Committees to the Scottish local health authorities

The section of the profession most vitally interested in national health insurance administration are the general practitioners None of these seven persons was a N H I practitioner The administrative and public health sides of the profession were disproportionately represented There is no reason to believe that N H I practitioners wish the service to be administered by the local health authorities There is evidence that they wish for an *ad hoc* authority as can be seen from para 817 (p 296) where the evidence submitted by the Scottish Committee of the B M A is discussed

A large part of the financial basis of the N H I service is provided by insured persons If the service is extended a still larger part will be provided by them It is essential that insured persons should have representation on the controlling bodies It is equally essential that doctors should be represented on the controlling bodies in order that they may have opportunities of conferring with representatives of the many interests which collaborate in the N H I service

Handing over the functions of the Insurance Committees to the local health authorities would in practice result in a further aggrandisement of the power of the local bureaucracy a further diminution of independence and a closer approach in a quiet Scottish way to the totalitarian State I hope and happily I believe that Scottish practitioners are aware of the danger—I am etc

THE BELFAST MEETING

ACCOMMODATION AND CRUISE ON S S "ALMANZORA"

To supplement the limited accommodation in an attractive manner arrangements have been made with the approval of the Council of the Association for provision of accommodation on board the s s *Almanzora* During the period of the meeting the liner will be moored in order that members may take a full part in all the social and scientific activities Moreover, the mooring berth will be adjacent to a tram service which will take members to the city centre in ten to fifteen minutes At the close of the meeting the liner will leave Belfast and proceeding via the Inner and Outer Hebrides and Scapa Flow will cruise in the Norwegian Fjords visiting Trondhjem Merok Hellesylt Oie and other places of interest The liner will return to Southampton on August 3 This cruise has been planned by Pickfords Travel Service in conjunction with the Royal Mail Lines and members of the Association who propose to attend the Belfast meeting and are interested in these arrangements are asked to make an early application to Messrs Pickfords at 205 and 206 High Holborn, W C 1, or at any of their branches

Sir Charles Hastings Clinical Prize

The Sir Charles Hastings Clinical Prize which consists of a certificate and a money award of fifty guineas is again open for competition in respect of 1935 The following are the regulations governing the award

1 The Prize is established by the Council of the British Medical Association for the promotion of accurate observation research and record in general practice It includes a money award of the value of fifty guineas

2 Any member of the Association who is engaged in general practice is eligible to compete for the Prize

3 The work submitted must include personal observations and experiences collected by the candidate in general practice and a high order of excellence will be required If no essay entered is of sufficient merit no award will be made It is to be noted that candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject though reference to current literature should not therefore be omitted when it bears directly on their results their interpretation and their conclusions

4 Essays or whatever form the candidate desires his work to take must be sent to the *British Medical Association* House Tavistock Square London W C 1 not later than December 31 1937 The Prize will be awarded at the Annual General Meeting of the Association to be held in July 1938

5 No study or essay that has been published in the medical press or elsewhere will be considered eligible for the Prize and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work A prizewinner in any year is not eligible for a second award of the Prize

6 If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay the decision of the Council on any such point shall be final

7 Each essay must be typewritten or printed must be distinguished by a motto and must be accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address

8 The writer of the essay to whom the Prize is awarded may on the initiative of the Science Committee be requested to prepare a paper on the subject for publication in the *British Medical Journal* or for presentation to the appropriate Section of the Annual Meeting of the Association

9 Inquiries relative to the Prize should be addressed to the Medical Secretary

and for strips of muscle suspended in physiological solution, and clinical experience with the oxytocic hormone also leads to the same conclusion as regards the human uterus That the spontaneous rhythmic contractions of the uterine muscle gradually increase during pregnancy and attain their maximum at parturition can be concluded from clinical observation as well as from experimental data

The alterations in the physiological activity of the uterine muscle during pregnancy are controlled by the ovarian hormones, the conditions being somewhat similar to those already discussed for the luteal phase of the menstrual cycle To what extent progesterone plays a part in the control of the activity and reactivity of the muscle of the pregnant uterus in species other than the rabbit is rather doubtful, there exists little positive evidence on the question, and further experiments on primates are very desirable There is a good deal of evidence, however, that the follicular hormone plays an important part in bringing about the gradual increase in the spontaneous rhythmic activity and reactivity to oxytocin which appears during the course of pregnancy, and that the culminating process of parturition may be dependent on the action of this hormone—that is, oestradiol The sudden and marked increase in the elimination of active oestrogenic material about the time of parturition also suggests that oestradiol is a causative factor in the mechanism of parturition

SURGERY OF THE THYROID GLAND

LECTURES BY SIR THOMAS DUNHILL*

LECTURE III

In his third and last Lettsomian Lecture before the Medical Society of London on March 1 SIR THOMAS DUNHILL dismissed the consideration of surgical technique by saying that it was best studied in the operating theatre Each surgeon varied in the details of his procedure He described and illustrated the operation table he favoured, drawing attention to the neck rest He added that his death rate had remained at about 2 6 per cent , it had never been below 2 5 or above 3 To his actual knowledge forty-one patients had died without operation after having made an appointment for consultation, or while awaiting admission, or during the first few days after admission Post-operative management should be easy but was often neglected The new tranquillity, the low pulse rate and regular rhythm, the increasing strength were sometimes liable to induce carelessness The regained health was worth guarding

Malignant Disease

Sir Thomas Dunhill said that he did not propose to cover the entire field of malignant disease of the thyroid gland, but only to make such observations as seemed to him of interest and importance Metastases might occur in malignancy of such a low grade that for a long time it might be regarded as innocent In no other organ did malignant change work slowly enough for its operation to be watched It had been seen how responsive was the thyroid epithelium to stimulation The morphological appearance of the epithelium might vary greatly in simple tumours To be of service to their patients they must recognize the very beginnings of malignancy, and for this they were dependent on histology If they who had the care of patients were to save the lives of some of them they must learn what changes were suspicious enough to justify their belief and line of action, show clinical evidence of such weight that it could not be ignored and re-examine the histological conclusions in the light of such knowledge

"Malignant adenoma" was not a perfect term but in the present state of knowledge it might be the most satisfactory It was intended to convey a malignant transformation, while the tumour yet maintained in some respects the morphological characters of an adenoma This type of carcinoma constituted a high percentage of the total number—the average in very large clinics was 85 to 90 per cent Benign adenomata differed from one another Some were composed of anastomosing columns of cells, in others differentiation had occurred and the tumour consisted of follicles When malignant transformation took place these ancestral characteristics were maintained to a considerable extent though ultimately the differentiation was lost and the cells grew in disorderly fashion, presenting the appearance conveniently called medullary, and many authors had given that name to a type of carcinoma

Often some degree of papilliferous activity occurred One could not say with certainty where normal tissue ended and tumour tissue began The incidence of papilliferous adenocarcinoma constituted about 24 per cent of his total but apparently this was not the case in some other countries One authority in Switzerland had mentioned its rarity there This type unlike malignant adenoma spread to neighbouring glands It was very slow in its evolution He mentioned four cases in which this change had been shown Of two he had lost trace, although he had kept in touch with both of them for over seven years One other had died in St Bartholomew's Hospital and in one the condition was causing extreme discomfort It was interesting that out of forty-five cases collected from literature including his own, the condition in twenty-five became obvious before the age of 30 and in fifteen before the age of 20 A third type was scirrhous which was infrequent it originated in the same manner as scirrhus in the breast

Illustrative Cases

Turning to illustrations of cases the lecturer mentioned one woman seen in 1930, in whom the histological examination showed at least three types of fibroid epithelium This case illustrated how the morphological types of epithelium might overlap He removed the tumour x-ray treatment was given at St Bartholomew's, and she was well for five years In 1935 the breathing became laboured on slight exertion and several quite severe haemorrhages occurred Examination showed a projection into the trachea, just below the larynx After she had been given an appropriate amount of x-ray treatment it flattened out

Speaking with regard to lymphadenoid goitre, Sir Thomas Dunhill said that when those who had as frequent opportunities as many of them had of seeing cases differed in their views he thought it meant that all cases did not run along parallel lines He quoted some cases which showed that lymphadenoid goitre could clear up and need not go on to myxoedema though it did so in certain instances He thought it could be taken that lymphocytic infiltration to a very high degree could occur whenever there was exhaustion of epithelial tissues Lymphadenoma might sometimes disappear, sometimes continue sometimes go on to myxoedema or fibrosis Rarely in these patients was any past history to be found No surgeon saw enough of them to generalize about them He had seen cases in which he had thought that focal

Scholarships and Grants in Aid of Scientific Research

Scholarships

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows an Ernest Hart Memorial Scholarship, of the value of £200 per annum a Walter Dixon Scholarship of the value of £200 per annum, and three Research Scholarships each of the value of £150 per annum These Scholarships are given to candidates whom the Science Committee of the Association recommends is qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease Preference will be given other things being equal, to members of the medical profession Each Scholarship is tenable for one year commencing on October 1, 1937 A Scholar may be reappointed for not more than two additional terms A Scholar is not necessarily required to devote the whole of his or her time to the work of research, but may hold a junior appointment at a university, medical school, or hospital provided the duties of such appointment do not interfere with his or her work as a Scholar

Grants

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the causation treatment or prevention of disease Preference will be given, other things being equal to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine

Conditions of Award Applications

Applications for Scholarships and Grants must be made not later than Saturday May 8, 1937 on the prescribed form, a copy of which will be supplied on application to the Medical Secretary of the Association B M A House Tavistock Square, London W C 1 Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated

Branch and Division Meetings to be Held

ABERDEEN BRANCH CITY OF ABERDEEN DIVISION—At 29, King Street Aberdeen Thursday March 18 8 30 p m Professor J R Learmonth Certain Aspects of Urinary Infection

BIRMINGHAM BRANCH—At Medical Institute Birmingham, Thursday, March 18 9 p m B M A Lecture by Professor John Morley (Manchester) Cancer of the Stomach Preceded by supper at White Horse Hotel Congreve Street at 8 15 p m

KENT BRANCH EAST KENT DIVISION—At Royal Fountain Hotel Canterbury Friday March 19 8 45 p m Dr Constance Pondel Work of the County Public Health Laboratories

LANCASHIRE AND CHESHIRE BRANCH BURNLEY DIVISION—Thursday March 18 Film of B M A World Tour 1935 Commentator Dr J Crighton Brimwell (Manchester)

LANCASHIRE AND CHESHIRE BRANCH PRESTON DIVISION—Joint meeting with Preston Medico Ethical Society at Preston Royal Infirmary Tuesday March 16 8 30 p m Dr John I Wilkinson (Manchester) Toxic Anaemias

METROPOLITAN COUNTIES BRANCH CAMBERWELL DIVISION—At Maudsley Hospital Denmark Hill S E Tuesday, March 16 9 p m Dr I Tennant Functional Nervous Disorders

METROPOLITAN COUNTIES BRANCH FINCHLEY DIVISION—At Finchley Memorial Hospital Tuesday March 16 8 45 p m Address by Professor James Young

METROPOLITAN COUNTIES BRANCH GREENWICH AND DEPTFORD DIVISION—At Dreadnought Hospital Greenwich S E, Tuesday, March 16 9 p m Clinical evening

METROPOLITAN COUNTIES BRANCH STRATFORD DIVISION—At Cecil Hill Park Avenue, Ilford, Tuesday, March 16, 9 15 p m Dr I Jenner Hoskin Cardiac Emergencies

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION—At Willesden General Hospital Harlesden Road, N W, Wednesday March 17 9 p m Dr S Levy Simpson The Menopause

NORTH OF ENGLAND BRANCH BISHOP AUCKLAND DIVISION—At King's Cafe Bishop Auckland Friday March 19 7 30 p m Annual dinner

NORTH OF ENGLAND BRANCH DURHAM DIVISION—At Durham County Hospital Tuesday March 16, 8 15 p m Miss A Lawrence Public Opinion and Medical Ethics At Lynchdale Abbey Hotel Thursday March 18 Dinner

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION—At Alnwick Infirmary Wednesday March 17 3 p m Mr T A Hindmarsh (Newcastle upon Tyne) Surgery of Toxic Goitre

SOUTH WALES AND MONMOUTHSHIRE BRANCH NORTH GLAMORGAN AND BRECKNOCK DIVISION—At Pontypridd, Tuesday, March 16 B M A Lecture by Dr William Evans

SOUTH WESTERN BRANCH PLYMOUTH DIVISION—At Central Police Station Wednesday March 17, 8 30 p m Demonstration of Scientific Methods of Crime Detection by Superintendent W J Hutchings Preceded by supper at 7 30 p m

SOUTHERN BRANCH ISLE OF WIGHT DIVISION—At Isle of Wight County Hospital Ryde Friday, March 19 3 p m Annual meeting Election of officers, etc 3 30 p m, Clinical meeting

STAFFORDSHIRE BRANCH WALSALL AND LICHFIELD DIVISION—At Stork Hotel, Friday March 19 8 15 p m Mr Alfred Danby A Practical Talk on Some Matters of Obstetrical and Gynaecological Interest

YORKSHIRE BRANCH WAKEFIELD PONTEFRACT AND CASTLEFORD DIVISION—At Strafford Arms Hotel Wakefield Thursday March 18 B M A Lecture by Dr H Letheby Tidy Certain Diseases of the Stomach Preceded by dinner at 7 45 p m

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses ophthalmology at Royal Eye Hospital April 5 to 17 plastic surgery, April 14 and 15 neurology, especially intended for general practitioners at West End Hospital for Nervous Diseases April 19 to 24 heart and lung diseases at Victoria Park Hospital April 10 and 11 fevers at Park Hospital April 17 and 18 infants diseases at Infants Hospital April 24 and 25 On April 3 there will be a special M R C P demonstration on pulmonary tuberculosis at Preston Hall and on April 6 at 8 30 p m there will be a special demonstration on the fundus oculi also intended for M R C P candidates

Obituary

SIR JOHN BLAND SUTTON, BT LL D

Past President Royal College of Surgeons of England
Consulting Surgeon Middlesex Hospital

We announced last week with much regret the death on December 20th in his eighty second year of Sir John Bland Sutton the eminent surgeon and naturalist whose active working life was spent in large part at the Middlesex Hospital to which he presented the Pathological Institute that bears his name There was a time early in his career when it seemed doubtful whether Bland Sutton would stick to pure science and the study of comparative pathology or become one of the leading surgeons of his time He decided fortunately for his many patients and the art of surgery, in favour of the latter course but he never ceased to be interested in zoology and comparative anatomy and pathology and his occasional papers on those subjects to the columns of the *British Medical Journal* were always welcomed by our readers

John Bland Sutton was one of the nine children of Charles William Sutton who married a daughter of Joseph Wadsworth of Northamptonshire farming stock He was born on April 21st, 1855 at Enfield Highway, Middlesex His father was what is commonly called in villages a naturalist a man interested in all forms of animal life and skilled in taxidermy Living in a country district John had every opportunity of gratifying that love for animals and plants which lasted all his life He used to say that watching his father stuff birds gave him his first introduction to anatomy and physiology Not being of robust constitution he spent a good deal of time in reading During the last two years at school he acted as pupil teacher in training for a schoolmaster's life but his innate interest in natural history in all its forms and his study of Huxley's Darwin's Owen's and Tyndall's writings decided him to take up medicine and become a surgeon It was at an unusually late age that he made this decision and he only took the preliminary arts examination for the College of Surgeons diploma in 1878 Once off he lost no time passed the L S A and M R C S examinations in 1882 and gained the Fellowship six years later He studied anatomy in Cooke's School and soon showing his unusual talent for dissection was offered a post as demonstrator He did not accept this, but joined the Middlesex Hospital School of Medicine in 1878, where he was immediately made a prosector by Henry Morris and went up for his examination in anatomy at the College with his own pupils He won a gold medal and scholarships at the school While demonstrator of anatomy he began to interest himself in its comparative aspects and prepared many specimens for the museum He visited Paris and Vienna and had the idea of practising ophthalmic surgery, but while at Vienna the senior demonstratorship of anatomy in his school was offered him, and this on the advice of friends he accepted in 1881 In the same year he became attached to the prosectorium of the Zoological Society of London and thenceforward took a keen practical interest in comparative morphology and pathology and in the welfare of all the inhabitants of the Zoological Gardens

In 1886 there was trouble at the Middlesex Hospital because all the surgeons went away on holiday in August and September and to meet it an assistant surgeoncy was created on condition that the holder stayed on duty in these months Sutton was appointed and thereupon made a practice of getting away in November He travelled very widely and from 1880 onwards made half a hundred voyages to all parts from Ireland to South Africa and the sources of the Nile and east and west over the Old and New Worlds In 1886 antiseptic surgery had gained ground in London, but the carbolic spray was regarded with disfavour Lawson Tait and other abdominal surgeons did not adopt such antiseptic methods the carbolic acid being an irritant and harmful to the peritoneum They used boiled water or aseptic methods and Sutton followed He soon got into trouble with his colleagues for his zeal for abdominal surgery especially for pelvic operations on women His observations on the reproductive organs of mammals led to a paper on cysts of the ovaries in animals which attracted the attention of Alban Doran and Lawson Tait In 1892 he received the Jacksonian Prize of the Royal College of Surgeons for a dissertation on diseases of the ovaries and uterine appendages In 1896 the Chelsea Hospital for Women was under a cloud and after inquiry and energetic action to reform its methods Sutton was appointed assistant surgeon and full surgeon six months later This gave him more scope for his abdominal operations and he disarmed public opinion by opening his theatre to professional men and women and by publishing his results widely in the journals A characteristic comment on this rather stormy period of his life is

"No great change has ever been wrought in Religion, Medicine, or Science without serious opposition Surgeons in this respect are no better than the silversmiths of Ephesus I may have won some credit for helping to put this class of surgery on a sound footing after dragging it out of obloquy which at one time threatened to overwhelm it"

He adopted the name of Bland-Sutton by deed poll in 1899 because a medical practitioner of the same surname and initials had opened a shilling dispensary close to his home, and some people thought that this was his own venture He took no notice of this confusion of names until he was rung up at night for cheap midwifery

Bland-Sutton was very popular as a lecturer to students and graduates, never lecturing for more than three quarters of an hour As a public speaker at medical dinners and elsewhere he was much in demand, his oratory being spiced with humour and homely turns of phrase, with apt illustrations and unexpected similes For the more formal occasions he took Sir James Paget as a model, committing the text of his address to memory beforehand In 1905 he was elected full surgeon to the Middlesex Hospital, retiring in 1920 From 1910 to 1927 he served on the Council of the Royal College of Surgeons of England He had been Erasmus Wilson Lecturer at the College in 1885–7, Bradshaw Lecturer in 1917, Hunterian Orator in 1921, and in 1923 was elected President, this office he held for three years, and during its tenure was created a baronet, having been knighted in 1912 He was chosen as first President of the Association of Surgeons of Great Britain and Ireland on its foundation in 1919, and as a tribute to his work for the science and art of surgery his portrait in colour, reproduced from the picture by John Collier at Lincoln's Inn Fields, was published in the *British Journal of Surgery* to commemorate his seventy-fifth birthday

In *The Story of a Surgeon* (1930) he gave an account of his own beginnings, aspirations, climbings, and successes —a very diffuse very readable story by a man who always knew what he wanted and how to get it Several of his best addresses were published as *Selected Lectures and Essays* (1920) In the preface to this book he says

"I taught almost daily in the Middlesex Hospital Medical School from 1880 to 1920 Now like a reaper binding his sheaves I venture to collect a few lectures and essays and present them to the old students They may serve as reminders of the hours we spent together studying the dead with the hope of aiding the living'

The first thirteen chapters of this collection represent a fourth edition with rearrangements and additional matter of his little book on *Ligaments*, which first appeared in 1887 A score or more different subjects are dealt with, some of general interest from the Bible and the Apocrypha, as well as others of pathological and surgical interest These essays and lectures display a wide knowledge of general literature and a power of apt quotation, and are most interestingly illustrated with over a hundred figures Of much the same flavour is *Orations and Addresses* (1924), a book very characteristic of the man, revealing his varied knowledge in the spheres of human and comparative anatomy, morphology, and pathology He tells us that while waiting for practice, like John Hunter he taught human anatomy for capital and comparative anatomy for interest The chief paper so reproduced is the Hunterian Oration Here is brought to light the remarkable similarity of scientific inquiry which possessed the two men, for probably no other surgeon since Hunter's time had so extensive a range of curious interests in the animal creation generally or in the collection of freaks Bland-Sutton's intense love of animals made him a frequent visitor to the Zoological Society's Gardens, and for many years he was a general honorary consultant on diseases of the birds, beasts and reptiles there There was scarcely a paper or address by him on human anatomy or ailments but he managed to work in something apropos and interesting about the lower forms of animal life In 1917 he was appointed a War Office representative with the rank of lieutenant-colonel for collecting pathological specimens illustrating gunshot injuries, which were finally entrusted to the Royal College of Surgeons The collection was described in the *British Journal of Surgery* (1919) in a most interesting paper The excellent preparations, with careful clinical histories, were a very valuable accession to the Hunterian Museum

Of his other writings must be mentioned *The Diseases of Women*, a handbook for students and practitioners, first published in 1897 in collaboration with the late Arthur Giles, and *Tumours, Innocent and Malignant* (1893) Eight years were occupied in collecting material for this latter work, the underlying idea of which was to classify tumours on an embryological basis and to illustrate them by comparative pathology It was his most successful book, and reached a seventh edition in 1922 Princess Marie Louise, when furnishing the Dolls' House for Queen Mary, asked him to write a book on *The Principles of Doll Surgery* (1922) for the library His versatility was quite equal to the task It is written in the style of a work on operative surgery, and contains 74 pages 1¼ by 1 inch in size Each page contains an average of fourteen letters engrossed in antique script, with the initial of each chapter illuminated as in an old missal

Sir John Bland-Sutton was President of the Medical Society of London in 1914, of the Royal Society of Medicine in 1921–2, and of the International Cancer Conference held in London in 1928 He joined the British Medical Association in 1884, was honorary secretary of the Section of Surgery at the London Meeting of 1895, and vice-president of the same Section when the Association met again in London in 1910 He received the honorary degree of LL D from the Universities of Aberdeen, St. Andrews, Birmingham Glasgow, and Leeds, the D Sc from Toronto, the M Ch from Trinity, Dublin, and the M D from Bordeaux In 1905 he constructed at the back of his house (now demolished) in Brook Street, W., a complete replica, reduced by one-third, of the Apadana, or hall of honour, built by Darius I for his palace at Susa In this wonderful dining court with its columns and enamelled bricks, Sir John and Lady Bland-Sutton dispensed a generous hospitality

SIR ALFRED WEBB-JOHNSON writes

With the passing of a man of such remarkable personality as John Bland-Sutton it is fitting that a word should be written of those sides of his life and character which may not find place in a more formal appreciation

Bland-Sutton was privileged to live to his eighty-second year When he first realized that his time of active operative work was finished he was inclined to regard it as no privilege to live on, but as he got used to the idea of having laid aside his working tools he began to appreciate that he had been vouchsafed a great blessing He had the happiness of seeing those works to which he had set his hand established on a firm basis and bearing rich fruit He had the special joy of seeing his hospital recognized as one of the greatest hospitals and medical schools and research institutes in the kingdom He saw the Royal College of Surgeons going from strength to

temporary plating of a compound fracture in order to save the limb If metal must be used the stainless variety of steel was certainly the best

Mr BROOMHEAD, in replying on the discussion mentioned that people who were particularly tall tended to be much longer in uniting than did people of average stature, also in multiple fractures the tendency was for union to be rather delayed as though there were some substance in the body which had to do with bony union and which expended itself in producing a tall person and was inadequate to cope with the multiple fractures so often seen nowadays As to the supposed increase in the number of non unions, it must be remembered that the total number of fractures was greater, and naturally the number of non uniting cases also increased, but he did not think the proportion was greater

SIGMOIDOSCOPY IN TROPICAL PRACTICE

At a meeting of the Royal Society of Tropical Medicine and Hygiene on February 18, with the president, Sir ARTHUR BAGSHAWE in the chair, papers on sigmoidoscopy in tropical practice were read by Dr P MANSON BAHR and Lieut Colonel A G BIGGAM

Dr MANSON BAHR said that a knowledge of sigmoidoscopy as a means of differentiating the various forms of dysentery from each other, as well as from other diseases of the large intestine, was invaluable to the tropical physician In the Tropics sigmoidoscopy had hardly received the attention it deserved especially in the diagnosis of the various stages of amoebic dysentery For the true appreciation of the minor changes in the mucous membrane as viewed with a magnifying eyepiece, a knowledge of the normal appearance of the mucous membrane of the rectum and sigmoid was essential After describing the valves of Houston and Nelaton and the recto sigmoidal sphincter, he drew attention to the openings of the racemose mucoid glands situated immediately above the internal sphincter not to be confused with the small depressions or pits so often seen as the result of chronic amoebic ulceration

The account of amoebic dysentery lesions as seen by sigmoidoscopy had been compiled from a study of 183 cases of proven amoebiasis in which either the active forms of *Entamoeba histolytica* or its cysts had been recognized in the faeces The acute stage or a surface infection with the amoebae producing a superficial excoriation as seen in the artificially produced disease in cats was seldom observed in man He had seen three cases in which there was a contused or bleeding granular surface resembling that of ulcerative colitis, in these it was easy to demonstrate the organisms in large numbers in scrapings obtained by a Volkmann spoon from the diseased surface In one instance the amoebae had been found in the blood and mucus stool passed before examination In amoebic dysentery the earliest lesions observed were small yellow elevations or papules which represented undeveloped ulcers, later these appeared as small red depressions with haemorrhagic margins The mucous membrane in between the individual ulcers was folded or ridged, and it was of a pale yellowish pink colour Usually small petechial haemorrhages were seen dotting the surface Occasionally large solitary ulcers up to 1 cm in diameter were discovered, and might be so indurated as to simulate a malignant ulcer, but amoebae could be found in scrapings from the ulcerated surface Attention was also drawn to amoebic granuloma, or the hyperplastic form of lesion, which closely resembled carcinoma and had been well described by American observers In chronic amoebic dysentery, when *E histolytica* cysts were present in the faeces, the lesions in the rectum were not so easy to detect The ulcers were often represented by minute depressions or "pits," giving a "pock marked" appearance and could only be detected with a magnifying eyepiece These pittings really represented the scars left by the ulcers in the more acute stage and their development could be traced by observing the healing of ulcers under specific treatment with emetine The response to emetine and emetine bismuth-iodide was remarkable, the ulcers granulated with extraordinary rapidity, and all traces might disappear within ten days from the initiation of specific treatment The sigmoidoscopic appearances of chronic bacillary dysentery were as a rule, difficult to distinguish from those of certain stages of ulcerative colitis The inflammatory process permeated all the layers of the bowel wall The chief features were the partial stenosis and the spongy and easily traumatized mucous membrane These cases were more frequently met with as the result of infections contracted in the great war and were now more rare The serum agglutination test afforded a further diagnostic measure In doubtful cases of sprue sigmoidoscopy was also of value In the acute stage the mucous membrane was of a rose red colour, and the typical light coloured faeces could be seen in the upper part of the rectum, in the later stages it was pale yellow and parchment-like

Lieut Colonel A G BIGGAM illustrated his remarks with coloured paintings made from actual cases by Mr Strekalovski, and with a series of microscopical preparations If, he said, a case of bacillary dysentery was seen early an accurate diagnosis could usually be made by cytological examination of the stool or by isolation of the causative organism Later laboratory investigation was frequently of little help In such cases the visual examination of the mucous membrane just inside the sphincter afforded a view of the mucosa adequate for identifying the type of infection In amoebic ulceration the characteristic sigmoidoscopic appearances were the discrete nature of the ulcers and the healthy intervening mucous membrane in contrast to the diffuse inflammation of a bacillary infection In very debilitated subjects amoebic dysentery might clinically simulate an acute bacillary dysentery infection In them the identification of small islands of healthy mucous membrane persisting between areas of extensive ulceration would give the clue to the diagnosis The course of an amoebic ulcer could be followed by repeated examination Under specific treatment complete healing was the rule, the mucous membrane reverting to its normal condition

With regard to malarial colitis, he emphasized that in subtertian malaria there might on occasion be acute dysenteric symptoms indistinguishable clinically from those of bacillary dysentery The sigmoidoscopic appearance of the mucosa varied from patchy hyperaemia to scattered haemorrhages and areas of superficial necrosis These lesions disappeared rapidly after adequate quinine treatment

In endemic areas of schistosomiasis symptoms caused by infestation with *S mansoni* might give rise to an erroneous diagnosis of amoebic or bacillary dysentery Differentiation could be readily effected by employing the sigmoidoscope The earliest recognizable change was a patchy hyperaemia of the mucosa In these patches small more intensely hyperaemic areas not elevated above the surface, could be discerned in the mucosa As the disease progressed these areas became elevated finally to form polypoid masses Later still degenerative changes led to ulceration of these papillomata Under treatment by tartar emetic the early lesions rapidly subsided if however they had progressed to the polypoid stage resolution did not occur In this type of case dysenteric symptoms might persist for years Many of these polypi could be removed through the sigmoidoscope by electric cautery or diathermy

Discussion

Dr C C CHESTERMAN was particularly interested in the type of papillomata produced by the terminal spined

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTHS

ANDERSON—On March 2, 1937, to Dr and Mrs J S Anderson Grove Hospital, Tooting Graveney SW17 a son

MCLETCHIE—At the Rubislaw Nursing Home on March 6, 1937 to Wilhelmina Stephen Greene, wife of J L McLetchie MB ChB DTM and H, Colonial Medical Service Nigeria, a daughter

MARRIAGE

BROOKS—LACY—On Saturday March 6, 1937 by licence at Emmanuel Church Plymouth, by the Rev Carnegie Knox, Dr Rosslyn K Brooks, elder son of Captain Henderson Brooks IMS (ret) and Mrs Henderson Brooks to Kitty, only surviving daughter of the late Mr H C Lacy and Mrs Lacy of 1 Collings Park, Plymouth Future address Stone House Chipping Sodbury Gloucestershire

DEATH

CRESSWELL—On March 1 1937 at a nursing home in Bath Richard Cresswell, MRCS LRCP DPH Lond of Portishead and late of Cheltenham, aged 93 years

eggs of *S haematobium* in the bowel In the Congo he had never noted anything like that in infestation with *S intercalatum* All that sigmoidoscopy showed in infestation with that schistosome was reddening and a sandpaper appearance in the lower bowel, polyps had never been observed

Dr N HAMILTON FAIRLEY pointed out that preparation for sigmoidoscopy involving the use of aperients and cleansing enemata might alter the appearance of the mucosa If the mucosa bled on swabbing that was good evidence of inflammation Sigmoidoscopy was of value in determining non-tropical causes of blood and mucus in the stools, and it should be remembered that carcinoma sometimes coexisted with either active or latent amoebiasis In the absence of cellular exudate in the stools sigmoidoscopy rarely yielded positive findings of tropical interest The usual sigmoidoscopic pictures were well known Rarer forms included amoebic granuloma of the rectum or colon, readily confused with carcinoma, and amoebic proctitis with more or less uniform involvement of the human rectum similar to that described in experimentally infected kittens In his opinion chronic bacillary dysentery was rarely met with among Europeans from the Tropics, when it did occur it was impossible to distinguish it from the chronic ulcerative colitis of Bacillary dysentery was a self-limited disease which killed or cured, and examples of so-called chronic bacillary dysentery among prisoners of war and inmates of gaols in India probably originated from multiple reinfections over long periods

Dr GOLDBERGER said that proctosigmoidoscopy should be practised as a routine procedure by every physician investigating bowel trouble He then described his special instrument which by means of a telescope gave a magnification of some ten diameters It was particularly suited for strictures, and could be passed as far as 35 cm up the bowel By attaching a tube and using water pressure it was possible to clease the bowel of blood and mucous exudate during the examination

Dr MANSON-BAHR in reply, said that definite puckering of the bowel did sometimes follow the healing of extensive amoebic ulcerations That was the only point on which he was at variance with Colonel Biggam

BIOMICROSCOPY OF THE FUNDUS OCULI

A meeting of the Royal Medico Chirurgical Society of Glasgow was held in the eye department of the Western Infirmary on February 19 with the president, Mr G H EDINGTON, in the chair Professor A J BALLANTYNE read a paper on biomicroscopy of the fundus oculi

He said that ophthalmoscopy was essentially a branch of microscopy, for with the ophthalmoscope they examined structures which were more or less transparent under varying degrees of magnification and with various forms of illumination Since there were many lesions of the fundus which it was difficult or impossible to explain by histological methods, it was all the more necessary that every refinement of ophthalmoscopy which made the ophthalmoscope a more perfect microscope should be employed The communication was designed to show how this purpose could be served in two ways—namely, by focal illumination of the fundus and by the use of filtered or selected light In the biomicroscopy of the interior segment of the eye focal illumination was employed in five ways by direct illumination, by lateral or proximal illumination by retro-illumination, by examination in the zone of specular reflection and by examination in optical section Within certain limits these methods all had their application in the examination of the fundus oculi The modern interest in the examination of the fundus with selected or filtered light dated from Vogt's employment of an approximately red-free light to demonstrate that the yellow spot was not merely a post-mortem phenomenon, but could be seen in the living eye In many other ways the view of the fundus obtained with the red-free light differed from that obtained with the mixed light of the electric bulb, and for most purposes the light of the mercury vapour lamp was a good substitute An entirely different picture resulted from the use of a sodium vapour lamp This lamp provided a bright monochromatic yellow light, which enhanced the definition of fundus details Clear definition was further assisted by the fact that the vessels stood out darkly against a pale background Surface reflexes were abolished and the retina was rendered more transparent Hence deep seated lesions especially in the choroid were more easily seen The advantages of focal illumination and of examination with selected light could be obtained without costly apparatus

Dr JOHN MARSHALL gave a lecture demonstration of the various types of appliances—magnifying glasses, binocular magnifiers, telescopic spectacles, and contact glasses—which could be used to improve the vision in amblyopia, arising from such conditions as retrobulbar neuritis, central choroidal degeneration, partial cataract and conical cornea There was a full display of the appliances

Nystagmus

Dr I C MICHAELSON discussed nystagmus He described the postural reflexes which controlled the automatic movements of the eyes the purpose of these reflexes was to maintain the eyes as long as possible in the same position relative to the visual field The different stimuli for these reflexes arose in the retina the proprioceptive system, and in the semicircular canals Physiological stimulation of the last-named produced a nystagmus with a slow component designed to maintain the relationship of the eye and the visual field, and a quick component which was the result of supranuclear stimuli from the cerebrum Pathological nystagmus was described as being ocular, vestibular, or central nervous, according as the aetiological factor which impinged on the physiological reflex was disease of the eye, ear, or central nervous system The pathological anatomy, clinical features, and differential diagnosis of the various types of pathological nystagmus were discussed, including that found in disseminated sclerosis

PLACENTA PRAEVIA

At a meeting of the Edinburgh Obstetrical Society on January 13, with the president Dr DOUGLAS MILLER, in the chair, Professor JAMES HENDRY of Glasgow and Professor DUGALD BAIRD of Aberdeen read a paper on the treatment of placenta praevia

They reviewed first the opinions expressed at a meeting of the society in 1925, when the same subject was discussed Caesarean section was then thought suitable for a few hospital cases but vaginal methods of controlling haemorrhage and effecting delivery were given first place, and no reference was made to the importance of making up the patient's blood loss From the consideration of large series of cases collected by various workers there appeared to be a uniform international standard of maternal mortality for this complication in the neighbourhood of 7 per cent Limited series had been reported showing a much lower mortality, and the speakers felt that much better results could be obtained

A series of ninety fatal cases of placenta praevia occurred in the Glasgow Royal Maternity Hospital within the period 1925–34 Death was due to haemorrhage in fifty-four cases and sepsis in thirty six cases Two groups were recognized (*a*) those arriving in hospital in good condition, and (*b*) those arriving in poor condition The mortality was higher in the latter, it also increased with the degree of placenta praevia

The following recommendations suggested themselves to the speakers (1) If possible every case of placenta

infection had an important effect on the thyroid gland and all had seen the good result that occurred when a source of focal infection was removed He was inclined to think that this must start in some focal infection elsewhere and for some reason at present not understood its emphasis was on the thyroid gland It was one of the pathological conditions not yet solved They could only record their observations he did not think they ought to romance about it too much '

Vote of Thanks

At the conclusion of the lecture Sir WILLIAM WILLCOX in expressing the thanks of the society to Sir Thomas Dunhill, said that during the Melbourne Meeting of the British Medical Association in 1935 he had learned with what great affection and respect Sir Thomas was regarded in Australia Since he had made his home in England he had evoked a similar affection and respect from his colleagues here The subject of which he had treated in these masterly lectures concerned an extraordinary organ The thyroid gland acted like a flue to a furnace and could increase the metabolism of the body in a remarkable way He had been impressed by the fact that toxic factors might increase the activity of the thyroid It was important always to see whether there was any toxic focus which was acting as a cause of hyperthyroidism or as a stimulus to the activity of the gland The thyroid gland also had a very profound influence upon the immunity of the body Those suffering from hyperthyroidism were extremely sensitive to any infection such as tonsillitis or influenza when the activity of the gland might be so stimulated that a fatal thyrotoxicosis resulted

Sir JAMES WALTON said that it was only the older members of the profession who realized how recent had been the progress in the work upon the thyroid gland It had been said that the whole of the surgical treatment of the thyroid dated from the development of the Spencer Wells forceps, but for long after that surgical treatment was limited practically to localized adenomatous growths To day the whole aspect had changed great progress had been made, a large number of lives had been saved and enormous amelioration of symptoms obtained To Sir Thomas Dunhill more than to any other man did the medical profession owe the knowledge of what cases to select for operation He had widened the scope of treatment bringing in those cases of cardiac disease which a few years ago would have been pronounced hopeless

Professor F R FRASER added a few words of commendation of the lectures It was through the collection of cases around Dunhill thanks to his successful methods of surgical treatment that physicians like himself had had the opportunity of studying the disease and the after history of patients

---

A F RIZZOLO (*These Paris* 1936 No 824) states that generally speaking small pox in the United States is of the mild form, the fatality being relatively low (0 9 per cent) During the decennium 1921–30 there were 380 890 cases with only 3 484 deaths, as compared with a fatality of 23 1 per cent in France among 1,573 cases during the period 1925–8 The efficacy of vaccination in North America is shown by the following incidence of small pox in various States, according to the stringency of the vaccination laws In ten States with a population of 32 775 000 inhabitants where vaccination is compulsory, there are only 6 6 cases of small pox per 100 000 inhabitants In six States with a population of eighteen millions, in which vaccination is facultative, there are 51 3 cases per 100 000 inhabitants In twenty nine States with a population of sixty millions, in which there is no law on the subject there are 66 7 cases per 100 000 inhabitants and in the four States (Arizona, Minnesota North Dakota and Utah) in which vaccination is definitely discouraged there are 115 2 cases per 100 000 inhabitants Rizzolo comes to the conclusion that vaccination should be made compulsory throughout the United States by a federal law

SCIENCE COMES TO THE HOUSE

AN EXHIBITION IN LONDON

A small exhibition has been arranged by the Department of *Scientific* and Industrial Research at the Building Centre 158 New Bond Street London to illustrate the application of science to building especially domestic construction The exhibition, which remains open until March 25 is not the usual assembly of the *competing* products of commercial firms but a demonstration of the work of the various research organizations controlled by the Department or associated with it These include for example the Forest Products Research Laboratory the *Water Pollution* Research Board, and the various associations concerned with research into fuel iron and steel *non ferrous metals* rubber, paint colour, and varnish

Building Amenities and Noise

The National Physical Laboratory has chosen some *interesting* examples of contributions to building amenities One of these is an artificial daylight window intended for rooms and corridors where little or no natural light is available This little window fitted with semi transparent glass, gives a very cheerful illumination but on turning the casement on its hinges one looks out not on the open landscape, but on a specially shaped silvered reflector with *lamps* above The laboratory is also devoting a good deal of attention to noise transmission in buildings Propaganda against noise has in the main been directed very properly, against street and factory noises, but with an ever increasing population living in flats the very trouble some source of noise from the people in the flat above ' demands attention The laboratory has devised a floating floor which deadens impact noises such as footsteps This is a supplementary floor supported upon the structural flo[illegible] er blocks The device may not b[illegible] for the tenants of less luxurious [illegible] that something of this kind will have to become standard practice if it is to be tolerable for people to live on the top of one another

Water Supply and Heating

The Water Pollution Research Board is showing a process of water softening by means of base exchange materials particularly synthetic resins These are familiar to most people for other domestic uses as in electrical insulators but here starting with a special tannin and with formalin usually met with as a disinfectant a resin is produced which can remove the metallic parts of any salts in water whether calcium, magnesium or iron leaving the corresponding acids which themselves are removed by a second resin made from formalin and a product obtained from coal tar On water being passed through these two resins in succession any unwanted material can be removed and the water rendered nearly as pure as distilled water Another device shown by this body is a filter for removing the whole of the lead in drinking and cooking water The Fuel Research Station has an exhibit instructive in the principles of domestic heating The radiant efficiency of the open fire is shown to depend on many factors the most important being the recessing of the grate the depth of the fire from back to front the shape of the fire brick and the obstruction of the bars in front Air supply to the fire has within limits little effect on the efficiency but affects the rate of combustion Efficiency is however very much affected by the type of fuel The radiant efficiency of coal is said to vary from 19 to 24 per cent and for low temperature coke up to 33 per cent The more free burning the fuel the less draught is required It is also shown how the type of grate should be related to the properties of the fuel to be used

The whole exhibition at the Building Centre suggests that a large amount of knowledge on all these subjects has already accrued as a result of scientific research, and how very much of it remains as yet unapplied

praevia should be dealt with in a maternity hospital or well equipped nursing home, but a blood transfusion should be given in the patient's own home before she was removed if she was already collapsed for this purpose a mobile blood transfusion unit should be organized (2) The importance of warning haemorrhages should be more fully appreciated (3) All cases of ante partum haemorrhage should be examined vaginally only under circumstances which allowed of efficient treatment being carried out at once and then only by a person qualified to carry out such treatment (4) The blood loss must be replaced by blood transfusion (5) Caesarean section should be considered far more often as it offered a very satisfactory form of treatment (6) The successful treatment of placenta praevia required the co operation of the general practitioner and the hospital staff The speakers suggested that if due attention was paid to these points a relatively small number of cases would in future be classified as unavoidable deaths

Caesarean Section

During the last six years 228 cases of placenta praevia had been treated in Professor Hendry's unit, with a maternal mortality of 2.7 per cent For patients admitted *in good condition and in whom the placenta did not reach* the internal os puncture of the membranes was carried out Occasionally in such a case if bleeding had ceased and the child was very premature expectant methods were sometimes adopted Where the placenta praevia was central, or the placenta partially covered or reached down to the edge of the internal os Caesarean section was performed in practically every case—expectant treatment was never considered The number of cases treated by Caesarean section had risen to 64 per cent. during 1936, the more frequent use of this operation had been made possible by blood transfusion so that women arriving in poor condition could be safely operated on An efficient blood transfusion service had been established most of the 200 donors living near the hospital

Vaginal packing had been discontinued except in grave emergencies Practitioners were encouraged to send all cases of ante partum haemorrhage into hospital for diagnosis without themselves making a vaginal examination a blood transfusion was given before any such examination was made if the patient's condition was unsatisfactory Version was only used in eight cases in which the vagina had been packed before admission During the last two years eighty-seven consecutive cases of placenta praevia had been dealt with on the lines described with only one death—a mortality of 1 1 per cent—this death was due to the giving of incompatible blood The foetal mortality rate in this series was 43 per cent where version was used it was 81 per cent where the membranes were ruptured 32 per cent , and following Caesarean section it was 30.2 per cent

One hundred women who had a Caesarean section performed for placenta praevia more than two years previously were re examined, so as to estimate the end results In ninety no abnormality was found and their general health was good *In only three symptoms referable to* the operation probably due to adhesions were present Fifty four of the patients had been sterilized at operation as many of them were over 40 years of age and considered they had large enough families Of those not sterilized it was calculated that there was a sterility rate of 8 7 per cent A group of women who were treated by vaginal methods in the same years as those who had Caesarean section were examined as to end results 15 per cent were found to be in poor health, and the sterility rate was calculated at 18 per cent From this it seemed that the end results of Caesarean section compared very favourably with those of the vaginal methods of treatment, and the dangers of sterility and rupture of the uterus in a subsequent pregnancy or labour were probably not nearly so great as had been thought

Local News

SCOTLAND

Appointment to the Department of Health

The Secretary of State for Scotland has appointed Dr James Macalister Mackintosh to be Chief Medical Officer of the Department of Health for Scotland in succession to Dr J L Brownlie, who retired last November Dr Mackintosh who was born in 1891, was educated at Glasgow High School and the University of Glasgow, where he graduated M A in 1911 and M B , Ch B in 1916 , he proceeded to his M D in 1923 In 1920 he took the diploma of public health of London University and later became a barrister at law of Gray's Inn During the war he served in France first as a combatant and later in the R A M C and after the war became for a time medical officer to the Ministry of Pensions Devoting himself to public health he became assistant medical officer of health for Dorset, and in 1924 assistant medical officer of health for Burton on-Trent where he organized an orthopaedic scheme Later he became *deputy medical officer of health* for Leicestershire and in 1930 medical officer of health and school medical officer for the county of Northampton Dr Mackintosh has taken much interest in movements associated with the promotion of public health being chairman of the Propaganda Committee of the British Social Hygiene Council, and a member of the Central Council for Health Education and of the executive of the Association for Mental Welfare and Child Guidance

Glasgow Maternity Hospital

Glasgow Royal Maternity and Women's Hospital has received a gift of £25 000 from Mr Archibald Walker who has been a director of the hospital for over fifty years and who retired from the chairmanship last year Professor D M Blair of the chair of anatomy at Glasgow University speaking at the annual meeting of the hospital said that this institution was the largest of its kind in the British Isles The statement which had recently been made in the House of Commons that the maternity hospital service was a matter of sending out untrained students to look after women in confinement was an entire misrepresentation The students were well-trained final-year students who had behind them the entire medical staff of the hospital, and if any student was unable to cope with a case he could call upon the qualified medical staff, who again might call upon the visiting or consulting staff if necessary The usefulness of this system was shown by the fact that in the last five years there had been only twelve maternity deaths per annum giving a total rate of 0 5 per 1,000 The speaker also referred to the blood transfusion service, *which had affected the vital statistics* of the hospital, and to the necessity for the hospital to play a part in increasing knowledge of obstetrics by research work A study had been made here regarding certain lesions of the pituitary gland which had been found with unexpected frequency This was a new disease which seized women just after childbirth and led to an extreme degree of malnutrition enfeeblement and ultimately to death Six cases had been identified by the director of research in the past six *months and this suggested* that it was much less rare than was previously thought Further study would probably lead to the discovery of a successful form of treatment

Dr P Mauriac dean of the medical faculty and professor of clinical medicine at Bordeaux has been nominated corresponding national member of the Academie de Medecine and Dr J Verhoogen of Brussels and Professor Davide Giordano of Vienna foreign corresponding members of the Academie de Medecine

STANDARDS OF HOSPITAL CONSTRUCTION

REPORT OF DEPARTMENTAL COMMITTEE

A Departmental Committee was appointed by the Minister of Health over three years ago to consider the costs of the construction and maintenance of hospitals, and has now issued its first report, which deals with the acute general hospital,[1] specifically the hospital provided by the local authority. The committee of fifteen, under the chairmanship of Mr Adam Maitland, M.P., and with six medical members, heard evidence from the Ministry of Health, the various associations of local authorities and of their servants, also the Society of Medical Officers of Health, the Royal Medico-Psychological Association, and bodies representing architectural, structural engineering, gas and electricity, and other interests.

The committee soon reached the conclusion that it is not practicable to express standards in terms of cost. Building costs vary with period and locality, and there are other difficulties. The common method of computing "cost per bed" is open to many fallacies. The cost even of smaller hospitals does not vary directly with the number of beds. One hospital may have an out-patient department and another not, one may be staffed to a greater extent than another by non-resident personnel, one may be a completed institution and another planned with a view to early extension, all of which reflects itself in cost per bed. The committee therefore avoids cost figures so far as possible and discusses the respective advantages of different methods of planning and equipment.

The Ward Unit

The term "ward unit" is taken to mean a self-contained unit under the charge of one sister comprising about thirty beds in one or more wards with associated service rooms. The committee thinks that such a ward should include at least four one-bed rooms. As to whether the remaining twenty-six beds should be in one large ward or two or more similar wards there is much to be said on both sides. The smaller wards offer greater privacy for the patients, provide opportunity for classification, limit the spread of infection, and facilitate periodical cleaning. The large ward is simple and economical to plan, easier to supervise by the nursing staff, and lends itself more readily as a rule to a good arrangement of window space. The committee is evidently impressed by the advantage of replacing the large ward by smaller wards. It recognizes that this plan may mean increased capital cost, though this need not be more than £4 or £5 per bed, and with a moderate degree of subdivision, such as the replacement of the main ward by two smaller wards, a plan might be devised which would entail no extra cost at all.

The space per bed is usually expressed in cubic feet, and this is also open to a fallacy because height is relatively unimportant in comparison with floor area and distance between bed centres. With an adequate area to each bed and sufficient distance between adjacent beds the height can be determined by considerations of proportion and amenity. The committee found general agreement among its witnesses that for convenience of nursing in acute medical and surgical wards a wall space of eight feet between bed centres is desirable. As for the total width of the ward, having regard to the traffic along the central gangway, the London County Council has ordained twenty-six feet, the Ministry of Health in 1924 recommended twenty-four feet, which would leave ten feet for the gangway. The committee's view is in favour of the greater width.

[1] *Departmental Committee on the Cost of Hospitals and Other Public Buildings. First Report. The Acute General Hospital.* H.M. Stationery Office. (1s. 3d. net.)

Operating Theatre Suite and Special Departments

More precise figures are set out for the operating theatre and ancillary rooms. It is considered that a good average provision of floor space for an operating theatre in a non-teaching hospital would be twenty-two feet by eighteen feet, for the anæsthetizing room 140 square feet, and for the sterilizing room with hand-washing facilities for surgeons and nurses 230 square feet in a single suite and 300 square feet when there are two theatres and anæsthetizing rooms with ancillary accommodation common to both. Stress is laid on the desirability of direct access from the anæsthetizing room to the theatre and of exit from the theatre other than through the anæsthetizing room.

A reception department, in which patients are received and examined before being sent to the wards as usual in municipal hospitals, and suitable dimensions are given for the waiting and examination rooms. It is considered that the out-patient practice of local authorities has not yet become standardized enough for structural standards to be put forward. Nor are the x-ray and massage and electrical departments suitable for the application of standards. The size and equipment of the laboratory must depend upon whether it is self-sufficient or called upon to deal only with certain classes of work, the rest being sent to a central laboratory. Some suggestions are made with regard to the administration block, kitchens and offices, dining-rooms, stores, and dispensary.

Residential Accommodation

It is considered that in an acute general hospital of, say, 400 beds residential accommodation should be found for the medical superintendent and his deputy, five other medical officers, matron, sisters, and nurses to the number of 133, and maids to the number of twenty-four. A separate house should be provided for the medical superintendent and small houses or self-contained flats for one or more married medical officers. Without such separate accommodation outside the administration block it is considered that it would be difficult to retain the right type of man in the hospital medical service. The appropriate room accommodation for married officers is indicated. Other resident medical officers may be housed in the administration block, each medical officer to have a sitting-room and bedroom and there should be a common dining-room with serving pantry. The accommodation for the matron and nursing staff is also discussed.

Another detail of the hospital on which not always sufficient thought is expended is the mortuary block. A working rule is laid down that the average acute general hospital requires mortuary places in the proportion of 3 to 4 per cent. of the number of patient beds. A convenient arrangement is a rectangular room with a series of compartments in two or three tiers ranged along the back wall. A mortuary for twelve bodies should be of 300 square feet, and the post-mortem room, for one table, of a similar dimension.

The report embodies much interesting information elicited in evidence on the engineering, constructional, and finishing side. The best finish for the floors of wards is said to be hardwood, but a satisfactory substitute at about half the cost is thick linoleum which should have a life of twenty years. On the subject of temperature and air-change the committee had to feel its way through a multitude of diverse opinions. Consulting engineers and medical superintendents were not agreed within 5° as to the temperature for the wards, within 10° as to the corridors, and within 15° (65° to 80° F.) as to the operating theatres. On air-change the opinion was even more divided, ranging between one and a half to five changes an hour for wards and between four and twenty changes an hour for operating theatres. In its conclusions the committee steers a middle course between these opinions. The experts differ over matters small and great,

ENGLAND AND WALES

Cardiff Corporation Fracture Service

We have received from the medical officer of health of Cardiff (Dr J Greenwood Wilson) a pamphlet on the Cardiff Corporation Accident Service, of which he and Dr A O Parker of the Prince of Wales Hospital Cardiff, are the authors The service is believed to be the only one of its kind under municipal control, and it is claimed as a good example of what may be done with existing local resources without embarking upon new and costly schemes of building and equipment The Corporation has opened at City Lodge, which was formerly a Poor Law institution, a self-contained fracture clinic Under the same roof, though with a separate entrance and with a different medical and surgical staff except for the visiting consulting surgeon, is a new central orthopædic clinic The fracture block consists of a reception room, a massage room with six treatment cubicles, and a plaster room with a portable x-ray apparatus There are eight beds which are available for short-stay cases On the acceptance of a patient for treatment a general and x-ray examination is made, and should fracture be diagnosed the displacement is reduced Whenever possible the patients are allowed to go to their homes and are given an appointment to attend the clinic for after-care Cases which require hospitalization are transferred from City Lodge, which is in the centre of the town, to Llandough Hospital, an appropriated public health municipal hospital three miles away The patient's private practitioner is notified of the diagnosis and acquainted with the treatment that is being carried out It is said that practitioners make increasing use of the fracture clinic and readily refer their patients for treatment and after-care During the first twelve months of the service the total number of accident cases treated for the first time was 673 and the attendances were 2,917 Of the fractures and dislocations 270 were of the upper extremity and the clavicle, and 156 of the lower extremity The total cost of the service for eleven months from the opening in September, 1935, was £2,492, and for the last five months of that period, during which an almoner had been at work, £789 was recovered

Guy's Hospital Dental School

The annual clinical meeting of Guy's Hospital Dental School, said to be the largest gathering of its kind in the Empire, was held on March 6, and attracted, as usual, several hundreds of former students who came to renew old acquaintance and to watch demonstrations of modern procedures by members of the staff In two theatres operations for dental cyst and other procedures of dental interest were carried out by surgeons of the school, and in the anæsthetic rooms of the out-patient department there was a demonstration of anæsthetics The prosthetic and dental research laboratories, the denture room, and the children's department (the last given up to an exhibition of orthodontic cases and appliances) were full of eager groups In the large conservation room, which accommodates more than seventy dental chairs, demonstrations were given on gingivectomy, root canal treatment, preparations for bridge abutments speech training, facilitation of extractions using the impactor mallet, apicectomy, and practical applications of tooth carving In the x-ray room radiographs showing representative pathological conditions were exhibited, and in the denture room there was a display of impression technique and denture design At a semi-public luncheon the dean of the school, Professor T B Johnston, who presided expressed the view that in the next eight or ten years there would be a large increase in the openings for members of the dental profession and the number of students at present coming forward would not be sufficient to fill them The Government plans for physical training, the demands of the Services (where the most fruitful cause of rejection of recruits was caries in some form or other), the obvious desirability that the work done by the school dentist should be continued after school—at least until the young person entered national health insurance, when he might or might not come under dental benefit—and generally the new awareness of dental health on the part of the community, all pointed in the same direction, and meant that the present 7,000 qualified dentists would not be enough to meet national requirements A call for an increase in the number of dental students would not necessarily advantage Guy's Hospital, which was limited in the number it could take, moreover its dental students must be rather fewer than its medical students An increased number of applicants however, might perhaps enable the school to be a little more selective in its admissions The visitors were then taken round the school by Mr Bocquet Bull, the sub dean, and Mr W E Herbert the director of the department of conservative dental surgery Extensive as the premises are, the accommodation is overtaxed, and a scheme of replanning will have to be undertaken during the next few years From small beginnings just over fifty years ago it has grown to a department with 114 dental chairs in constant use and about 100,000 attendances of patients annually The total number of students in the school is a little over 300, of whom about 130 are senior students working in the conservation room It is the school's boast that about one quarter of the dental practitioners who qualify in this country are Guy's men

Rescue Work in North London

The good work which is being done by the Children's Moral Welfare Committee—now also styled "Rescue and Preventive"—for the boroughs of Holborn, St Pancras and Hammersmith has already received comment in these columns (*Journal*, 1936, **1**, 484) The committee's eleventh annual report shows that during last year it dealt with a considerably larger number of cases, nearly all the increase being in preventive work, in which, it believes, it is most accurately fulfilling its function On the other hand, less follow-up work has been possible and a smaller number of cases have been carried forward An after-care helper is necessary to release the present worker for more of the earlier rescue and preventive activities which she wholeheartedly carries out on the committee's behalf Outside adult rescue workers have been appointed in Holborn and St Pancras and some of the after-care work of the committee has already been turned over to them In several of the year's cases it has been necessary to reorganize the family life of the child, and the committee has been able to secure a change of environment and a holiday for a whole family instead of sending the child away alone Of the 159 cases dealt with, thirteen children were placed in homes, twenty two were referred to other agencies, forty-five were visited and advised, and fifty-nine are under supervision The case records, however, do not show the wide educational aspect of the committee's work and the extent to which it fosters a true preventive outlook It is representative happily, of a large and increasing number of moral welfare committees which perform this invaluable work in London and the provinces Copies of the report may be had from the honorary secretary, Miss T M Pagan, 7, Ampthill Square, N W 1

The annual malaria control course for laymen (engineers, planters, etc) will be held at the London School of Hygiene and Tropical Medicine, Ross Institute of Tropical Hygiene, Keppel Street, Gower Street W C, from June 21 to 25, under Sir Malcolm Watson, director of the Ross Institute The course includes instruction on mosquitos and their habits, drainage and other measures for the prevention of malaria, and an address by Dr G P Crowden on "Insulation against Heat and Cold" The course is free, and full particulars may be obtained from the organizing secretary at the Institute Applications should be sent to him as early as possible

even as to the quantity of hot water which might be considered a reasonable provision for different types of hospitals, but if this variety of opinion rather destroys the crispness of the conclusions it makes the report more interesting One pays one's money and takes one's choice And the money—1s 3d—is very little for the mass of information and impression which the committee has assembled

THE CASE FOR PASTEURIZATION

POOLE CORPORATION BILL

At a meeting of the Section of Medicine of the Royal Society of Medicine reported in our last issue (p 518) Dr W G Savage who opened a discussion on milk as a factor in the cause of disease made reference to the outbreak of enteric fever in Bournemouth and Poole last summer The Poole Corporation Bill, which has been considered by the House of Lords committee, would among other things provide for the compulsory pasteurization of milk for human consumption Dr R J Maule Horne medical officer of health for Poole has prepared a memorandum on that part of the Bill which deals with this important problem (Part IV Section 21, Poole Corporation Bill 1937) Dr Horne writes

A national campaign for improvement of nutrition is at present prominently before the country An important feature in nutrition especially for the young centres on the consumption of milk But milk should be both clean and safe if it is to be considered a factor in nutritional progress otherwise as the Government's Advisory Committee on Nutrition has said Milk is a medium through which disease may be conveyed to man Scientifically only clean milk can be made safe It is the submission of the promoters as a body who have the public health as their special charge that efficient pasteurization of milk provides the best known most immediately practical and least prejudicial method of rendering the fluid reasonably safe from a bacterial point of view for human consumption

In the past allegations have been made that the pasteurization of milk far from protecting against disease has, in fact been the cause of it On investigation of such statements it has always been found either that the pasteurizing process in question was not efficient or that the introduction of infection was due to some avoidable factor subsequent to pasteurization For this reason the Bill would give the local authority power to refuse to grant licences unless satisfied that the heating apparatus meets with the requirements of the Ministry of Health and it will also control by by laws the utensils for storage and the methods of delivery of the milk The need for a safe milk supply was discussed by the Representative Body of the British Medical Association at the Annual Meeting in Oxford last year, following a recommendation from the Council of the Association that only milk complying with the conditions required for the designations tuberculin tested or pasteurized could be safely consumed without boiling

Milk borne Infections

Dr Horne goes on

It can only be the possession of the well known characteristic of the ostrich which makes it possible for the British Dairy Farmers Association to accept without qualification the statement made at their general meeting in 1933 that it was medical humbug to make out that bovine tuberculosis could be transmitted to human beings and that all this talk about the risk of contracting tuberculosis by drinking milk from tuberculous cows is rot

Recently Dr Ernest Ward president of the Society of Medical Officers of Health pointed out that 2 000 to 2 500 persons mainly children, die in this country each year from tuberculosis of bovine origin, and that twice that number are made seriously ill and that apart from tuberculosis there are many epidemics that owe their origin to the consumption of unsafe milk There have in fact been about one hundred outbreaks of milk borne epidemics in the last thirty years In 1924 fifty seven cases of paratyphoid fever were notified in the borough of Chorley in the months August–September The infected milk supply was stopped on October 1 and no further cases appeared A similar outbreak on a larger scale affected 166 persons in Hertfordshire in 1927 More recently in March 1935, there was an outbreak of milk-borne scarlet fever at Denham and in August–September of the same year in Chelmsford and Chelmsford rural district there were 487 cases of scarlet fever with six deaths the infection coming from raw milk supplied by one farm where eight employees were found to be in an infective condition

Poole Bournemouth and Christchurch suffered from an outbreak of milk borne infection in August last About 900 persons were affected with typhoid fever of whom about 400 were temporary visitors on holiday in Bournemouth and the surrounding districts There were fifty one local deaths from the infection which was due to raw bulked milk infected by a focus which is at present the subject of investigation by the Ministry of Health The outbreak was checked as soon as the infected milk was pasteurized After visiting the district Sir Kingsley Wood Minister of Health said Pasteurization immediately cut the outbreak short and it has since run a normal course and can now as I have said be regarded as over The outbreak illustrates once again the difficulty of ensuring otherwise than by pasteurization a safe milk supply where the milk is derived from many sources and pooled before distribution

Finally there has been the outbreak of scarlet fever at Doncaster in December of last year 186 cases were notified and there were three deaths all directly due to infection of raw milk by a dairy worker with tonsillitis (*Journal* January 2 p 26)

In Poole itself the fact that only pasteurized milk is authorized for use in schools under the authority of the local education committee and for mothers and infants supplied under the maternity and child welfare scheme of the borough has already done much to pave the way for the general introduction of pasteurized milk The medical officer's memorandum concludes

The foregoing particulars of outbreaks associated with the consumption of raw milk could be confirmed by other instances of the gross dislocation of the life of a community the untimely loss of useful or potentially useful lives the needless heavy expenditure—the cost of the outbreak of last autumn in this district in hospitalization alone was £34 000—but the promoters hope that they have submitted sufficient evidence to show that the power sought to require the efficient pasteurization of milk circulating in the borough is reasonable and justified in the interests of the community and that if they did not make this endeavour to safeguard their community from a recurrence of their recent tragic experience they would be guilty of an almost criminal neglect of a duty which with the facilities available they consider obvious

Dr Horne's memorandum is an effective summary of the case for pasteurization The need for legislation on this problem of safe milk seems to be recognized by everyone except perhaps the British Dairy Farmers Association In the past clauses relating to pasteurization have had to be struck out of Bills presented to Parliament by various local authorities It is to be hoped that Section 21 of Part IV of the proposed Poole Corporation Bill will not meet with the same fate

---

Sir Humphry Rolleston Bt GCVO KCB has accepted the chairmanship of the medical board of the Eichholz Clinic 204 Great Portland Street London in succession to the late Lord Moynihan The clinic employs a staff of blind chartered masseurs and is administered by the National Institute for the Blind

Royal Medical Benevolent Fund Centenary Appeal

SIR—It may be of interest to your readers to have a brief summary of the results up to December 31, 1936, of our special centenary appeal

During April, 1936, we posted to 44 694 medical practitioners (at a cost of £590 16s) an appeal signed by Sir Thomas Barlow, president of the Fund, together with a historical review of the hundred years' work of the Fund, compiled by Sir Humphry Rolleston The Centenary Fund was opened by the very generous lead of Sir Thomas Barlow, who made a gift of £1,000 which has been followed by 596 donations amounting to £3 570 11s 7d It was noted that of these 596 donations no fewer than 337 were from subscribers who already give annual contributions and only 259 donations were from those who had not previously supported our benevolent work In addition to the above, after the dispatch of the 44 694 appeals 117 practitioners signified their wish to become annual subscribers to the amount of £149 10s, and a few old subscribers increased their subscriptions, adding a further £23 12s to our annual income

The administrators of the Fund felt that the response from the profession as a whole had been somewhat disappointing and consequently decided to send out a reminder to the appeal In November 1936 (at a cost of £65) 6 523 letters were posted to practitioners in the postal districts of London who were known not to be subscribers to the Fund, and each was asked for a small contribution such as an annual subscription of 5s To this appeal 286 replies were received, of which 220 had signed bankers' orders, thereby becoming annual subscribers of a further £101 5s

Our committee has decided to keep the Centenary Fund open until April, 1937 when the centenary year will have ended *A reminder is being sent this month to every* practitioner in England, Scotland and Wales who has not yet responded to the appeal We earnestly beg those of your readers who are not already subscribers to fill in the banker's order for 5s as soon as they receive this final appeal, which will reach them in the course of the next few days—We are, etc

Protamine Insulin

SIR,—The announcement *from four British firms in* your last issue that a preparation of protamine zinc insulin of British manufacture will now be available in this country is of great interest to everyone occupied with the treatment of diabetes, *it is, however desirable to emphasize* the mild words of warning included in the letter announcing its appearance on the market

The new insulins have come to stay their slower action not only enables the physician to reduce the number of daily doses in many cases but reproduces more exactly the theoretical manner of insulin secretion in health It is probably on this latter account that so many patients report a considerable improvement in their general feeling of well being when the new products are employed But *in some instances the change over to one of the new* insulins as the herald of a period during which insulin reactions may be frequent and sometimes severe to the point of danger, for this reason the change should only be made when the patient is under close medical supervision, and unless this rule is strictly observed the introduction of the new products may result in major or minor catastrophes liable to mar the record of a most valuable advance in therapeutics

Having employed protamine insulin for many months I am convinced of its immense value but I am also familiar with the serious difficulties which must arise when any potent drug is introduced with an action sufficiently slow to carry with it the risks of cumulative effect When such a substance has the further property of being variable in its potency owing to changes of the amount held in suspension in different conditions, and of being liable to alteration when slightly contaminated by sterilizing fluids it is clear that considerable care is required in its administration

For these reasons I feel it necessary to express a warning as well as a welcome in this letter—I am, etc,

London W 1, March 8 T IZOD BENNETT

Prostatectomy

SIR—A measure of heat has developed in the correspondence between Mr W K Irwin and Mr W W Galbraith on the relative merits of certain operative procedures for the removal of the prostate gland Fortunately a rise of temperature of this kind is never serious it falls to normal in the subsequent atmosphere of thought and reflection

The views expressed in Mr Irwin's original communication indicating that the two stage operation for prostatectomy is the method of choice were followed by a letter from Mr Galbraith condemning the whole procedure and strongly advocating the Harris technique Surely we should not be wedded to any one ritual in dealing with the diverse problems which arise in the average case of prostatic obstruction Each case requires the detached and impartial consideration that experience dictates Furthermore the type of operation should vary in accordance with the surroundings In a propitious atmosphere where the preoperative and postoperative treatment can be carried out under good conditions the Harris operation or its predecessors as described by Thomson Walker and Judd may be adopted without misgiving assuming of course that nothing in the patient's condition precludes operations of this type

The operation must of necessity sometimes be performed under adverse conditions and then the two stage method is one of the best Those who perform the Harris operation *should in justice to the memory of a great surgeon* insist upon the detailed precautions originally described I allude to the preoperative and postoperative care Mr Galbraith has referred to them but their importance may be *overlooked* From Harris's insistence upon scientific treatment before and after operation and the necessity for care and judgement in the general management of the case we may infer that he was one of those who considered the term operating surgeon as obnoxious and that he realized the fundamental distinction which often exists between first class operators and first class surgeons Harris was by no means a mere technician he was what Wallace alludes to as an operating physician a term which accurately signifies the line of modern thought

THE MEDICAL SOCIETY OF LONDON

ANNUAL DINNER

The Medical Society of London held its 162nd anniversary dinner on March 4, when a large number of fellows and guests were present, the president SIR WILLIAM WILLCOX, being in the chair. After the loyal toasts had been honoured, Lord WRIGHT proposed the health of the society. It was, he said, a great honour to be present at a meeting of such an ancient society, founded as it was in 1773 by John Coakley Lettsom. The law, to which he belonged, was, owing to the fact that human nature changed but little a stationary profession. Medicine, on the other hand, was progressive. The one was an art and the other a science. It was medical science that had made the construction of the Panama Canal possible and which had been so invaluable in the conduct of the war.

In responding to the toast SIR WILLIAM WILLCOX thanked Lord Wright for the kind words he had said about the society to the members of which the memory of Lettsom was always green. To those who wished to know more about Lettsom he recommended the life written by Mr Johnston Abraham who was present with them to-night. The Medical Society of London, Sir William remarked, was almost the only medical society that did not admit women within its ranks. It was possible that this exclusion might not be maintained in the future. Reviewing the year during which he had been president he said that the position of the Medical Society of London was to-day better than it ever had been but the one thing it lacked was an endowment and he hoped that admirers of the society would in time supply the necessary funds. The number of fellows was now over 600, and among them were a large number of young and energetic medical men. Sir William then announced that Dr Arnold Chaplin had presented to the society nearly 400 engravings of famous medical men on condition that the engravings were suitably housed and catalogued. Dr Chaplin hoped that this would form a nucleus for a large collection. On behalf of the society the president warmly thanked Dr Chaplin for this generous gift.

The difficult task of proposing the health of the visitors was admirably carried out by Mr J. E. H. ROBERTS, who with short biographical notes welcomed the following: Lord Wright, Lord Burghley, Sir Arthur MacNalty, Sir Edward Tindal Atkinson, Lord Dawson of Penn, Sir Buckston Browne, Dr Arnold Chaplin, Dr Watson Smith, Dr A. P. Gibbons, the presidents of kindred societies, the Medical Directors-General of the Navy and Air Force, and representatives from the *Lancet* and the *British Medical Journal*. Responding for the guests, Lord BURGHLEY said that he spoke with the trepidation most people felt when they came into contact with the income-tax collector and the medical profession. One of the most remarkable characteristics of the medical profession to-day was its great activity. Discussing the question of fitness Lord Burghley said that other nations had stolen a march on us in the matter of physical fitness of the young and this did not apply only to the totalitarian countries. In the excellence of our social services we had led the world, but in the matter of physical fitness we had lagged far behind. There were two problems to be solved. The first and simpler was the provision of adequate recreational facilities. The second and more difficult problem was the changing of the mind of the young people in this country. To secure the end that was desired every organization had a part to play, and the medical profession could play the greatest part of all. SIR ARTHUR MACNALTY, who also replied on behalf of the guests, said that Lettsom [illegible] many of the questions to which those [illegible] public health were devoting their attention to-day—the importance of fresh air, good food, and good physique. Referring to the activities of past presidents of the Medical Society of London Sir Arthur told how during a cholera epidemic in 1854 Dr John Snow had informed the vestrymen of St James's that the water supply was at fault. The epidemic was controlled by the simple process of removing the handle from the Broad Street pump. Another president, Sir Benjamin Ward Richardson, had given in 1875 an address on the advisability of appointing a Minister of Health. Sir EDWARD TINDAL ATKINSON, also speaking for the guests, paid tribute to the medical profession for the assistance they rendered his department in dealing with medico-legal problems and in this connexion mentioned especially Sir William Willcox, Sir Bernard Spilsbury, and Dr Roche Lynch.

THREE YEARS OF L.C.C. HOSPITAL SERVICE

The administration of the L.C.C. hospital services which figured prominently in the elections decided on March 4 was the subject of a long review presented at the last meeting but one of the old Council by Mr Somerville Hastings, chairman of the Hospitals and Medical Services Committee. It was a statement chiefly numerical, of the developments and extensions of the last three years, the "life" of the outgoing Council. Many of the facts and figures given in the review have been recorded in these columns from time to time in notes on the Council's proceedings or reviews of its annual reports.

The number of hospitals under the control of the committee—seventy-four—is the same as it was in 1933. The accommodation in these hospitals shows a slight decrease on the figure of three years ago, or, if allowance be made for certain beds temporarily unavailable owing to reconstruction works, a slight increase. This situation at first sight rather puzzling in view of the ever-increasing demand on the hospitals, is explained in the report in the statement that side by side with the provision of new accommodation there has been a reduction in existing accommodation from two causes: (1) the modernization of existing unsatisfactory wards entailing the partitioning of portions of them for duty rooms, ward kitchens etc., and (2) the necessity for reducing the number of beds in overcrowded wards particularly as a result of the standards of bed space laid down by the Council in 1935 for various categories of patients. It is added that no patient whose admission was duly authorized was refused or indeed could be refused. Until the accommodation is increased sufficiently to render it equal to the demand in all exigencies the pressure of accommodation on many hospitals during the winter peak must continue to be met in the only way possible—by the provision of temporary extra beds in wards.

The new accommodation provided during the last three years consists of 996 beds and extensions are under construction or in preparation to provide a further 1,834 beds. Reconditioning schemes carried out at public health institutions allocated for use as hospitals have during the same period provided 1,038 beds suitable for chronic sick patients and a further 1,200 beds for this class are in prospect. Of the new accommodation 323 beds are for maternity patients. In addition, as already stated in the *Journal* of February 6 (p. 294) a new hospital of 500 beds has been authorized south of the Thames (at Tooting).

Increases in Treatment and Service

The admissions to the general hospitals in 1936 numbered 173,997, an increase of 24,000 on the figure for 1933 and the attendances of out-patients numbered 778,600, an increase of over 300,000. At the special hospitals in 1936, a year of measles epidemic, the number of admissions was 57,188, a falling off on the figure for 1933 and almost exactly the same as the figure for 1932, which was also a year marked by measles epidemic. Confinements in the Council hospitals increase by more than 2,000 every year. The number in 1936 was 17,831 comparing with 11,668 in 1933. The attendances at ante-natal

I think the following words of Harris illustrate what I desire to convey "The most careful aseptic and antiseptic ritual must be observed in the case of the indwelling catheter Any slovenliness in this regard, apart from any immediate ill effects, will reap its own harvest of post-operative septic sequelae" And again "The method so often seen of allowing the open end of the catheter to drain into a urinal between the patient s thighs is fraught with danger, and should no longer be tolerated" I venture to say that Mr Irwin is not on solid ground in his wholesale condemnation of the indwelling catheter Everyone recognizes its drawbacks He says it is to some patients an instrument of torture and to all a method of treatment conducive to sepsis I have recently (*Practitioner*, March, 1937, p 284 et seq) described the methods by which torture and sepsis can be avoided

In referring to the Harris operation Mr Galbraith says it is not the method for the occasional prostatectomist, as considerable experience in bladder surgery is essential and not a little skill I am disposed to take another view The operation appeals to those who are accustomed to deal with difficult plastic operations on the bile ducts, to those who repair cleft palates and perform the many plastic procedures with which the general surgeon is confronted as a daily routine I congratulate Mr Galbraith on his results following the Harris operation He says 'After the plastic operation (Harris) the vast majority of the patients micturate naturally after the withdrawal of the urethral catheter on the tenth post-operative day" He invites readers of the *British Medical Journal* to see the operation performed by a surgeon experienced in the correct Harris technique, and the smooth, comfortable, and speedy convalescence which follows I have seen many Harris operations performed by experts, but the results, although sometimes beyond reproach, were by no means as satisfactory as Mr Galbraith portrays On the other hand, Mr Irwin is particularly unfortunate in judging results by a case with a swollen penis, pus dribbling from the urethral meatus, and urine leaking from the suprapubic wound

I have had the privilege of watching the work of many of those who have studied intensively the problems of prostatic obstruction These included Freyer, Thomson-Walker, Judd, Squier Bumpus and many Continental observers I have seen also the methods adopted by a younger generation in London and in the great surgical centres in the provinces As a result of this and a long experience I vary the operation of prostatectomy to suit to the best of my judgement, each individual case The facilities for proper pre-operative and post operative care are often the deciding factor In most cases I plan the operation so that a clear view can be obtained of the prostatic bed This is a point against the two-stage procedure I fear the first stage of this last operation in bad risk cases, unless slow decompression is secured by means of the catheter or by a suprapubic tube introduced with the aid of one of Kidd s appliances To the suprapubic tube a glass dripper is attached (Mr Irwin draws attention to the necessity for such precautions) When the gland is removed and the cavity visualized it may be obvious that the wisest course is to leave well alone It may be advisable to secure a spouting vessel, and it is nearly always desirable to clear the area of tags and debris On the other hand a plastic operation of the Harris type may be the ideal Unless speed is essential the walls of the bladder are closed layer by layer, just as in intestinal suture For ten years I have employed open suction drainage as a routine when primary closure was contraindicated Open suction is a simple means of keeping the patient dry and clean It is difficult to prove but I am convinced that suction has diminished the incidence of post-operative haemorrhage

I have not adopted the Harris operation with the same enthusiasm as some of my friends and colleagues for two reasons In the first place I sometimes fear the very complications which Harris was able to eliminate—haemorrhage and sepsis—in the absence of a suprapubic drain. Unless there is unremitting vigilance after operation and personal attention is given with unceasing regularity these disasters may occur It is not always possible to fulfil these conditions. Furthermore, the boomerang needle does not appeal to me In discussing needles with Harris he told me he had experimented with many others, but I doubt if the various forms of cleft palate needles and holders have had a fair trial

Mr Galbraith reasonably raises the question of multiple anaesthetics in a many stage procedure Local anaesthesia however, is the ideal for suprapubic cystotomy After infiltration of the tissues in the middle line and exposure of the bladder the wall of the latter is infiltrated through a fine needle and the tube is painlessly introduced

Is there not a danger that we are losing our sense of proportion and judgement as regards the operation of prostatectomy? We lost it when Lane was treating every fracture with plates and screws with admirable skill, we lost it more recently in the surgical treatment of peptic ulcers Advocates of the two-stage operation, converts to the Harris method, and those who favour almost exclusively endoscopic resection are equally convinced they have reached Utopia All are surprised to find there is more than one main road The whole history of surgical progress suggests balanced judgement, conservatism in forming conclusions, and the avoidance of dogmatic assertion A fellow countryman practising medicine once told me he had found by experience that the surgeon who was never in doubt was invariably wrong!—I am, etc,

London, W 1, March 6 W I DE C WHEELER

Psychological Factors in Rheumatism

SIR,—In the exuberance of his attack on Dr J L Halliday, Dr James Cook has overlooked the fact that he is in complete agreement with Dr Halliday so far as the latter s main thesis is concerned In all the valuable papers which Dr Halliday has contributed to the *Journal* his principal theme has been to point out that many patients alleged to be suffering from physically determined disease are in fact the subjects of mentally determined conditions I gather that this is Dr Cook s view also The difference between their views rests on the fact that one of them thinks that malingering is common while the other would give weight to unconscious factors in many cases, but it is no more hazardous to correlate rheumatism with misfortune than it is with malingering

It is not surprising that these different outlooks should exist, for one of these observers draws his conclusions from a prison population and the other from people living in freedom It is true that the inmates of a prison do not differ very much from the rest of us as regards their essential make-up, but their environment is quite different from ours, and I fancy that if we found ourselves in that environment many of us would be tempted to make the most of any ailments we had

It is true that Dr Cook does not mention the word "malingering," nor does he say explicitly that his treatment was punitive, for these are dangerous words to use, but unless he implied them all that he says about prisoners is meaningless It is regrettable that he does not tell us whether he used the methods of isolation, purgation, and buttermilk diet in the treatment of rheumatic patients in his outside practice, seeing that he had so many cases, and as he had so splendid a panacea for the prisoners he must have devised something as useful for those outside, but he says nothing about them

I wonder whether Dr Cook ever considered that some of his prisoners, even after his strict examination, may in fact have suffered from physically determined pain, but

clinics reached just upon 120 000 compared with 58,000 three years earlier It is stated that there has been also a considerable increase in the attendances at the post natal clinics Some further figures show substantial increases in treatment and service at the general hospitals

	Operations	Massage and Electrical Treatments	X ray Films	Laboratory Examinations
1934	33 689	482 452	130 830	390 824
1935	37 365	544 007	169 773	441 767
1936	41 176	623 253	202 715	515 631

Among other details given in the report is an extended reference to nurses' accommodation Since 1934 new accommodation has been provided at various hospitals for 813 nurses, and it is under construction or in preparation for 1,596 others Each nurse has a separate bedroom and each departmental sister a sitting room in addition When a hospital has a training school for nurses and adequate accommodation does not already exist provision is made in the nurses home for lecture and demonstration rooms and library

The ambulance services, general and accident have their place in the multiplication table The number of persons conveyed in 1936 was 372,260 some 14,000 more than three years ago Finally as to cost the expenditure is given only from April to December of 1936, as the financial year runs from April to March The capital expenditure during those nine months was £348,653, and the maintenance £4,181,129 The committee claims that while the annual cost has inevitably increased the increase has been reasonable having regard to the extensive developments in all directions during the last three years and that this has been possible only by constant and close supervision and effort on the part of all concerned By the time these words are read it will be known how far the electors of London have endorsed this view

Reports of Societies

IRRADIATION, PRE- AND POST OPERATIVE, IN MALIGNANT DISEASE

A discussion on the value of pre and post operative irradiation in malignant disease took place at a combined meeting of the Sections of Surgery and Radiology of the Royal Society of Medicine on March 3, Professor GREY TURNER presiding

Mr W SAMPSON HANDLEY said that of the methods of radiation he thought radium more effective in quality and subject to fewer drawbacks than *x* rays, but both agents had their field There were not wanting sceptics who denied to irradiation any value in connexion with operations for carcinoma but their error was most clearly seen when considering post operative irradiation in the prevention of implantation recurrence After describing a short series of cases he said that they illustrated the reality of the danger of implantation of floating cancer cells in the operation wound and the effectiveness of radium in dealing with the condition If radium could destroy massive implantation recurrence it would, if applied just after operation, destroy the implanted microscopic foci For this purpose deep x rays would probably be just as effective as radium and more convenient

Implantation Recurrence

Implantation recurrence even when considered alone provided a wide field for the post operative employment of deep x rays There were indeed few cases in which the possibility could be excluded, and a short course of deep x rays should be applied to the scar after operation in all cases of gastric and pelvic malignant disease breast cancer and malignant glands in the neck He never advised pre operative irradiation except in rare cases as a possible means of converting a fixed inoperable growth into a mobile operable one, but he admitted that his decision against pre operative irradiation was based on *a priori* grounds, and might be considered as a prejudice Pre operative irradiation entailed unnecessary and undesirable delay in the performance of the operation and during the time of waiting the deep microscopic extensions of the growth which were its most dangerous part had time to make further advance He believed that some who practised this method postponed operation for as long as three months on that account The delay would not matter if it were certain that in the meantime the deep extensions of the growth were kept inactive by irradiation treatment but the evidence was the other way In cases treated by x rays only it was his experience that as a rule while the primary growth shrank and became mobile dissemination proceeded unchecked or only partially checked

It was certainly very difficult even with modern apparatus and methods to convey to any considerable depth beneath the skin a dose of x rays lethal to carcinoma cells To attempt the irradiation of carcinoma cells in the pectoral fascia or muscle through the whole thickness of a voluminous mamma was to impose on the method an extreme handicap but when the breast had been removed even deeper layers such as the intercostal muscles or the pleura were brought within a short distance of the skin and exposed to the full force of the radiation Again there were certain glands—namely the apical glands of the axilla and the internal mammary glands—which were so sheltered that he doubted whether they could be dealt with by any dose of x rays that the overlying skin could tolerate The apical glands in the axilla could easily be removed and the internal mammary glands could be treated at the time of operation by interstitial radium tubes but subject to any evidence from his radiological colleagues it seemed to him that no proof had yet been supplied that x rays could destroy the carcinoma cells in the internal mammary glands and he had proved that interstitial radium was competent for that purpose Until convinced of the equal competence of deep x rays he would continue to use interstitial radium for the internal mammary glands as a routine in all breast cancer operations

A decision as between pre and post operative irradiation on statistical grounds would not be possible for a long time to come The differences between individual cases of breast cancer were so enormous that large errors of sampling were inevitable The differences in the methods of individual radiologists were at least as great and the x ray tube was still undergoing evolution The best hope for progress in treatment appeared to lie in public education as to the vital necessity for prompt attention to suspicious lumps in the closer study on the part of radiologists as well as surgeons of the process of dissemination and in the adoption practically as a routine after carcinoma operations of a short prophylactic course of x rays at a voltage of at least 180 000

Pre-operative Irradiation

Dr W M LEVITT said that he did not think all surgeons would be as generous as Mr Sampson Handley in conceding a case for x rays in the routine treatment of carcinoma of the breast In a series of 100 cases of breast carcinoma a certain number would be well five years after treatment by surgery and a certain number would be well five years after treatment by irradiation The identity of the individuals in the two groups would almost certainly be different It was obvious that the factors which made for radio sensitivity and for operative success were

that after one course of his treatment they thought it wiser never to complain to him again about any symptom To silence a patient is not always to cure him A prisoner knows he has no redress in the matter of an internal scourging which leaves no marks that might be shown to visiting justices These are not pleasant thoughts, it is in truth very unpleasant when doctors in official positions let themselves become the people who mete out punishment

I do not agree that Dr Halliday seems to claim to have discovered anything new To me it seems that he is calling attention to something well known which is being neglected

On one point I am in full agreement with Dr Cook I hope he will remain guarded about psychoanalysis and not attempt to use its methods But that is not because I think that those who do so are necessarily "as queer as their patients —I am, etc

London W 1 March 6 T A ROSS

The Maudsley Hospital

SIR,—Your leading article (*Journal* March 6 p 507) on the organization of the Maudsley Hospital with its unrivalled sources of clinical material records Dr Mapother's opinion that it will be found necessary here as in the rest of the civilized world, to affiliate psychiatric clinics with teaching hospitals This is a policy which no one who is interested in general as well as psychological medicine could fail to endorse but it should be pointed out that there are two types of affiliation among the clinics abroad The more usual type of liaison is of very intimate nature, and the psychiatric clinic is in fact part of the general hospital and stands if possible in the same grounds This has advantages over mere affiliation advantages not only of mere proximity of the resources of one to the other, but advantages which derive from the identification of the psychiatric clinic with the general hospital

Professor D K Henderson of Edinburgh recently pointed out that the time is passing when it should be necessary for patients to be admitted to a mental hospital on different terms from those on which they are admitted to general hospitals, and admission should be as free to the one place as to the other Very much the most likely way of bringing this about is that psychiatric clinics should be as necessary a part of the general hospital as a children's clinic or a maternity ward is now There are clearly other advantages from the patient's point of view in being in a general hospital with all its facilities for investigation and treatment From the aspect of medical education the advantages are equally obvious From the scientific standpoint it is in a close association of this kind that the hope lies of raising psychological medicine in this country to the Continental and American standards —I am, etc,

London N W 1 March 8 R D GILLESPIE

Large Renal Calculi

SIR,—In the *Journal* of February 20 (p 387) Mr D J Harries gave an interesting account of a large renal calculus he removed and a list of large calculi that have been removed in the past It is of interest to know that Mr Hurry Fenwick removed a large renal calculus and several smaller ones from a man in Leicester in 1887 When dry, the single large calculus weighed 26 oz The patient lived for eight years after the operation I do not think Mr Hurry Fenwick published this case as no mention of it is made in any list The calculus was kept by the patient and many years later it was given to me by his daughter in law It is now in the Museum of the Royal College of Surgeons Roughly speaking it is the size and shape of a guinea-pig This calculus should be included in the list of such cases —I am, etc,

Evercreech Somerset Feb 25 DESBOROUGH BRODIE

Puerperal Inversion of Uterus

SIR —I was greatly interested to read in the *Journal* of January 30 (p 220) of a case of acute puerperal inversion

In my practice as a medical missionary in Northern Rhodesia I was called in December 1933 to see a patient—an African native woman of 19 years of age Eight hours before I saw her she had been delivered of a 6 lb male child this was her second baby her first being 18 months of age I strongly suspected that the placenta had been delivered by traction on the cord although the native midwife strenuously denied this rather too strenuously in my opinion

When I saw the patient she was suffering from a very mild degree of shock and from slight haemorrhage The uterus was completely inverted the fundus presented outside the vulva and the cervix was low down in the vagina That *portion of the uterus lying outside the vulva was caked with* dust from the mud floor of her hut Under chloroform anaesthesia the uterus was thoroughly cleansed and well swabbed with iodine and was then gradually and with extreme gentleness reduced No further treatment was given and unfortunately I was prevented from seeing her on the next day Forty hours after the operation of reduction I was more than a little surprised to see her standing on my veranda She had walked twelve miles to thank me for curing her There were no signs of sepsis temperature 97 8 F, pulse 72 and the uterus was felt by abdominal palpation to be in the normal position From the time when the inversion of the uterus had been rectified she had a perfectly normal puerperium Nine and a half months later she delivered a full time child the confinement being in every respect normal

The most striking points in this case were the comparatively slight amount of haemorrhage and shock and the complete absence of sepsis Incidentally in my four and a half years experience among the natives of Northern Rhodesia I have never come across any puerperal sepsis —I am, etc,

Cancer of the Breast

SIR —I would hesitate to take part in the interesting discussion on the treatment of cancer of the breast appearing in the correspondence columns of the *Journal* did I not feel that the dust of battle was obscuring at least two important considerations which should receive attention in any discussion of this important subject I refer to the fear of the surgeon's knife and the horror that many women entertain of the mutilation ablation of the breast inflicts upon them These are two factors that account for much of the regrettable delay in seeking treatment we are accustomed to meet with in these cases a delay which in the Hamburg census of 1908 was found to average eleven months and which has apparently not been much reduced since then

In the last twenty cases operated on for cancer of the breast at the National Temperance Hospital eleven or 55 per cent showed involvement of the axillary glands According to Mr Sampson Handley this would indicate that in these eleven cases already the internal mammary glands were also involved and the disease had passed beyond the reach of the surgeon's knife alone Cases therefore continue to reach the surgeon in a very late stage of the disease

widely different and even in some cases antagonistic The factors determining operability might be termed "mainly mechanical," whereas radio sensitivity depended upon certain obscure biological properties in the cell It was reasonable to suppose that if these methods of treatment were combined a more or less complete summation of success might be expected But how were they to be combined? Should irradiation precede or follow operation? How long was to elapse after the one procedure and before the other? What would be the dangers should x rays or radium be used? In the past, when the two methods of treatment had been combined, it was the common practice to carry out the radical operation first and to regard x-ray therapy as a rather doubtful safeguard following operation Carcinoma cells required a lethal dose of irradiation, whether they were living in small colonies which had escaped the surgeon's knife or in large colonies which were clinically appreciable Partly because of the tendency in the past to under-treat these cases post operative irradiation had so far produced no spectacular improvement in the published results, although the percentage of local recurrences had materially decreased Another factor was that few surgeons sent their patients for irradiation as a routine measure

Surgical Objections

The objection of the surgeon to pre operative irradiation was, in the first place, that it meant an undesirable postponement of the operation, and in the second place that the progress of secondary deposits was uninfluenced by the local irradiation, though it was equally true that the progress of secondary deposits was uninfluenced by immediate surgery Was the irradiation treatment capable of preventing the occurrence of fresh secondaries, and at what stage in the treatment? Surely the danger to the patient during this fortnight or so interval must be offset by the reduced danger of implantation at the operation A third objection was the difficulty of conveying x rays to the requisite depth, but this did not hold so far as high voltage therapy was concerned [illegible] were able to pass through bone almost the soft tissues

In favour of pre-operative irradiation was the definite experimental evidence, not only that the irradiated carcinoma cells were much less likely to flourish should they be implanted in the site of the operation, but that a considerable reduction in the size of the growth followed irradiation, and this must clearly be interpreted as meaning actual damage to the tumour cells Dr Levitt summed up in favour of pre operative irradiation with a reduced x ray dosage and without modification of the radical operation, followed by a supplementary course of post-operative irradiation An interval of from four to six weeks was recommended between the pre-operative irradiation and the operation The supplementary post-operative course should be given as soon as the patient had sufficiently recovered from the operation The post-operative field was unsuitable for interstitial radium, and with modern methods of deep x ray therapy protection of deep structures was easily obtained In pre operative irradiation he did not think that the choice as between the two agents was important With x-ray administration any anæsthetic was avoided, but, on the other hand, x ray treatment was tedious and required about three weeks to complete

Radiation Sensitivity and Resistance

Dr G F STEBBING asserted that in the treatment of malignant disease irradiation had a much wider field than surgery Many cases could be treated by irradiation for which for one reason or another surgery was unsuitable In carcinoma of the breast he started treatment on the assumption that by irradiation alone he would be able to get rid of the tumour Excision of the breast and adjacent structures was only performed when it was realized that irradiation by itself was not going to be successful Pre operative irradiation could be given for the following reasons (1) to reduce the size of the tumour by getting rid of the most radio sensitive cells, (2) to render the tumour more mobile, (3) to lessen the vitality of the tumour cells so that during the operation any of them which were sown on the surface of the wound had less chance of surviving to form local recurrences or metastases In the majority of tumours there were a certain number of very radio sensitive cells, and a very small dose of x rays therefore was better than none Post operative irradiation was only given on the assumption that the operation had left behind certain tumour cells It was generally thought that if tumour cells were sown on the wound surface during operation they would be more rapidly and easily destroyed than cells growing in a tumour This was unlikely to be true for cells which were in a resting state, and cells partially asphyxiated were more radio resistant than cells forming part of a growing tumour The only important thing was that each cell of the tumour, large or small, should receive the necessary amount of irradiation at the proper time After a radical breast operation it was not possible to deliver to that part of the wound over the chest wall an effective carcinoma-killing dose of x rays without doing lasting injury to the skin He doubted very much whether it was desirable to give any routine post-operative irradiation to the lateral aspect of the chest wall If and when recurrences appeared in this area they could be treated by radium, which entailed little constitutional disturbance to the patient

The position was different with the axilla which, with the supraclavicular region was a not uncommon site of recurrence Here irradiation could be so arranged that every lymph gland in the region could be given a carcinoma-killing dose without causing more than a temporary inconvenience to the patient For very superficial tumours such as local recurrences after operation applications at a few millimetres from the surface formed the best means of treatment with little discomfort to the patient Post-operative irradiation should always be employed where it was known or assumed that carcinoma cells had been left behind Suspected metastases even at a distance from the primary site should always be treated when they were accessible to irradiation and not so numerous as to render the effective treatment of all of them impossible

Theoretical Conceptions

Dr RALSTON PATERSON entered into a discussion from the theoretical point of view of the manner in which pre operative or post-operative irradiation was likely to act He did not think there was any substantial evidence that irradiation could in any way increase immunity or body resistance to metastatic growth A mild post operative irradiation might act as a temporary growth restraining factor This growth restraint was of undoubted value, but of no enduring importance, and did not come into the consideration of radiation as a curative agent. To be of value pre-operative or post-operative irradiation must be given in such doses as were known to produce definite lethal changes in whatever type of malignant disease was concerned There must be no difference between irradiation used as a pre operative measure and irradiation applied as a direct therapeutic agent Whether in the presence of obvious disease or not it had to be given as intensively as possible Mild prophylactic courses of irradiation were, frankly, a meaningless concept Further, irradiation carried out before or after an operative procedure would only be of value in that type of case where it was proved to be of value when used alone

A lesion genuinely inoperable when first seen could not be rendered operable by irradiation unless it were at the same time completely cured by that irradiation By a process of shrinkage of growth a condition might be so altered as to appear and feel operable, but such an appear-

Conceding for the sake of argument that Mr Sampson Handley's scheme of treatment is the best, is it not possible that this is an occasion when the best is the enemy of the good and that by constantly insisting on the best we are putting obstacles in the way of our doing the good, which, while falling short of the best, may yet be very good indeed? It seems to me possible that if the radiologist could only obtain in cases of cancer of the breast 50 per cent of the successful results claimed for surgery in operable cases, his total successful results in cases presenting themselves to him for treatment might considerably exceed the successful results of all cases presenting themselves for surgical treatment At the present time so many cases are seen so late that neither the surgeon nor the radiologist can hope for success Were the fear of the knife removed this most regrettable delay might to a great extent be avoided and the hope of successful treatment much increased

Early operation may offer the best chance of cure, but should we not face the fact that patients are unwilling to come early to the operating surgeon?—I am, etc,

London, W 8, March 1 HAROLD H SANGUINETTI

Ludwig's Angina Treated with Prontosil

SIR,—I read with interest Dr W H Palmer's report in the *Journal* of February 27 (p 472) on the efficacy of prontosil in a severe case of Ludwig's angina He remarks on his inability to estimate the value of the method by considering a series of cases so treated, since this line of treatment has in the main been confined to obstetrics it is unlikely that anyone could draw conclusions from a number of cases of cervical cellulitis so treated Yet what may be lacking in the experience of one man might be gathered from a lumping together of occasional cases if those responsible would trouble to report them If prontosil or any similar preparation can be relied upon with a high degree of certainty to prove effective in severe septic conditions of a streptococcal nature, such as cervical cellulitis, then we have at our disposal an agent that will relieve the surgeon and conserve the already depleted powers of resistance of the patient by eliminating the necessity for operation, not to mention preservation of the neck from disfiguring scars Dr Palmer's letter moved me to report the following case which I treated a month ago

A man, aged 25 passing through the immediate post-influenzal period, developed an acute alveolar mandibular abscess in the molar region on the left side The mouth was supposed to be edentulous but examination showed three root fragments It was decided that all the fragments should be removed, though only one of them was giving trouble at the time

This was done under gas and oxygen, and the patient appeared well No further trouble was anticipated Four days later I received a somewhat urgent request to see the patient I found him seriously ill with an extensive cellulitis from the malar process and infra orbital region to the clavicle on the right side From the horizontal ramus of the mandible to the thyroid cartilage the neck felt like wood Externally all anatomical landmarks were obliterated by the swelling and induration The floor of the mouth appeared to be a mass of sloughing tissue with a foul smell The tongue was upturned hard and fixed as though carcinomatous Rigors were experienced, the temperature was 103° F The case was not a pleasant one yet immediate incisions and drainage appeared to me the only life saving measure At the same time I realized that I might easily lose under the anaesthetic a patient whose recuperative powers had been so violently assailed

The patient fortunately solved the difficulty He did not want any more operating He became highly emotional and hysterical breaking down and sobbing freely It was then I decided to wait twenty-four hours longer and try the effect of prontosil As a matter of fact I used Evans Lescher and Webb's preparation, streptocide At the same time he had local treatment, which consisted of swabbing with a 2 per cent solution of mercurochrome, together with a cardiac tonic and free pugation

By the next day the external appearances were much the same, but I felt that the patient was not quite so ill He certainly was not worse, so I decided to continue with the streptocide On the third morning there was a surprising and gratifying change The temperature had dropped to 100° F, the external swelling was still much the same but the indurated area was softening The mouth itself showed a great improvement in that the sloughing was less and the tongue much freer From this time fairly hot lotions for the mouth were added to the treatment On the fourth morning the improvement was maintained and was so marked that I felt that the case was likely to recover From this time the improvement continued steadily Within eight days the patient was up and about, though there was still a little swelling and induration present under the symphysis and in the submaxillary region with some soreness on pressure along the sterno mastoid He made a good and complete recovery

Since most of these cases are usually streptococcal, and often dental in origin, it would appear a wise thing in the early days or hours of onset to prescribe prontosil or similar preparation freely—I am, etc,

Manchester, March 3 H LYTH

Physical Training and Pregnancy

SIR,—As the National Advisory Council for Physical Training is now in being I am writing to suggest that the opportunity might be taken to investigate the advisability of suitable exercises for prospective mothers In a book recently published called *Safe Childbirth* Dr Kathleen Vaughan indicates that much of the slow and difficult labour of to day is due to the oval pelvic brim as distinguished from the round brim which she has found in races where childbirth is easy She believes that suitable exercises will produce a better-shaped brim with more mobile joints Could not the attention of the National Advisory Council be drawn to this question?—I am etc

London, S E 19, March 4 M I BALFOUR

"Rachi-resistance" and Spinal Anaesthesia

SIR,—The recent correspondence concerning "rachi resistance" has been rather interesting From time to time in informal discussions about spinal anaesthesia I have heard remarks similar to those of Dr W R Black and Mr G A B Walters (*Journal*, January 30 p 218) A few anaesthetists, without being aware of the term "rachi-resistance," have said that some of their patients seem to have had a sort of immunity to the effects of spinal anaesthesia In 1929 and 1930, when we first began to use spinal anaesthesia according to the Pitkin technique as modified by Sise, there were a few failures which were ascribed to idiosyncrasies of the patients With increasing experience, however, these failures became extremely rare At the present time there have been approximately 2,500 anaesthesias with spinocain given in the Central Park Clinic, and based on this experience it is the opinion of myself and my associates that failure to produce anaesthesia is due to an error in the technique of administration

This statement applies only to a complete failure to produce anaesthesia We have had cases in which a desired level was not reached and in one of these we were able at a later date to demonstrate a partial block in the canal caused by an old fracture It is more than likely that many partial failures associated with a some

ance was deceptive in that damaged though not dead malignant cells were present A surgeon finding himself in difficulties and unable to effect a complete removal when he had expected to do so could not be rescued from his misjudgement as to operability by his *radiological* colleague either by calling for radium at the beginning or asking for x rays later Owing to the opening of the malignant tissue the patient's chances became less than they would have been had the case been treated as an inoperable one from the beginning Surgical excision and radical radiation treatment must be looked upon as two independent methods Half a treatment by x rays and half a treatment by radium might conceivably add together to produce a cure and be a whole treatment but half a treatment by surgery and half a treatment by irradiation could not summate to anything at all Each method of treatment must be very thoroughly employed so that it achieved in its own right a definite percentage of cures without leaning on the other except in so far as it was associated with it in actual clinical use

General Discussion

Miss LOUISA MARTINDALE showed an analysis of a long series of her cases proving the value of post operative *irradiation with x rays* Out of sixty six cases of breast cancer in which radical operation was followed by adequate deep x ray therapy, fifty three survived three years forty seven five years and twenty eight ten years In some cases she had also used pre operative treatment but only because she had had to keep the patient waiting for a bed in hospital Dr DOUGLAS WEBSTER expressed the view that in breast cancer post operative irradiation more or less doubled the value of the purely surgical result He had also treated post operatively cases of cancer of the cervix—mostly those in which hysterectomy had been done—and he was inclined to think again that the value of the operation result was doubled by the irradiation treatment The value of pre operative irradiation was most clearly shown in borderline or inoperable cases He had seen irradiation applied to large masses of growth in the breast with the result that a frankly inoperable case became operable, and although a large mass had still been left it had not regressed If pre operative irradiation could do so much in advanced cases it was likely that it could do still more in milder and operable cases

Dr G B BATTEN mentioned that Mr Sampson Handley had operated on one of his patients—a woman of 72—more than twenty five years ago for breast cancer the woman died five years ago at the age of 92 without recurrence All such operations had been followed by interstitial radium and post operative x ray treatment not at very high voltages—185 to 200 kV Dr J E A LYNHAM was not in accord with Dr Paterson when he claimed a surgical conception of post operative irradiation Dr Paterson's desire was to get a massive dose of irradiation into the tissues in a very short period but it was well known that where large tumours had been given massive doses of *x* rays and subsequently microscopic section had been done a certain number of cells had been found to have survived very often in the periphery of the mass where the intensity of the irradiation might be assumed to be the greatest Some of Dr Martindale's cases went back for many years, when high voltages were not used Surely there was something to be said for the sort of dose given in those days

Mr SAMPSON HANDLEY replying said that he thought Dr Stebbing over stressed the physical elements in radiation and under estimated the importance of pathological knowledge as the guiding principle Dr Stebbing had suggested that Mr Handley's method of introducing radium tubes along the borders of the mammary glands was a hit or miss method on the contrary it was a method of precision based accurately upon anatomical findings

UNUNITED FRACTURES

At a meeting of the Section of Orthopaedics of the Royal Society of Medicine on March 2 Mr WHITCHURCH HOWELL presiding, a discussion was held on the prevention and treatment of ununited fractures Fractures of the neck of the femur which have been considerably discussed were excluded

Mr A M A MOORE declared that the problem of non union which had exercised the minds of surgeons for a very long time was as acute as ever In conversation with other orthopaedic surgeons he had formed the view that the percentage of cases of ununited fracture was decidedly high He proceeded to a study of sixty five such cases at three hospitals with which he was connected in the London area Of these cases, which extended over a period of ten years forty six were originally simple fractures and nineteen compound, twenty nine of them occurred during the first half of the period and thirty six during the second half All of them were cases which had not united despite treatment for six months after the primary injury It was difficult to obtain particulars of the early treatment which had been carried out in nearly forty hospitals and other institutions The Wassermann reaction was tested in thirty nine of the cases and was positive in two One patient had chronic nephritis (this was the only one in whom any urinary abnormality was found) one had rheumatoid arthritis and one developed sclerodermia Complete blood investigations were carried out in nineteen cases, but no positive results were obtained It was suggested that the taking of an excessive number of x ray films had a bearing on non union and in one case forty five films had been made in four weeks but in this instance he did not think the number of radiographic examinations had had any part in the result No general factor accounting for non union was established Bone infection could be demonstrated clearly in nineteen of the series Very careful attention was paid to the possibility of over extension as a cause of non union Twenty out of the sixty five cases had been treated by skeletal traction over a long period during the primary treatment, and in some of this series the radiological evidence of over extension was clear His impression was that whilst skeletal traction was an extremely valuable method of applying extension it had often been used without reasonable care

Grafting Operations

Mr REGINALD BROOMHEAD spoke in particular of reconstruction operations and their technical difficulties In his series of cases the commonest site had been at the middle and lower third of the tibia next came the radius and ulna and much more rarely the humerus and the femur There were various opinions about the method of bone grafting One view was that a bone graft was only successful when chips were used He did not believe that bone chips in themselves were effective in treating ununited fractures Another view was that the graft would only take when its blood supply was preserved by having muscle attached to it but such a graft was manifestly technically impossible for all ununited fractures in the middle of a long bone He was strongly of opinion that if a bone grafting operation was to be done it must be carried out as a sound mechanical proceeding and the bone should be as large a piece as was compatible with the mechanical conditions present The graft also must be firmly fixed In the forearm bones where there was no weight-bearing the bridging of a gap was usually successful In the case of the humerus he thought it was best to make a Z shaped cut and to fix the ends together with two wires Operations on the humerus were not at all easy and in order to make a good Z shaped cut so that there was apposition of the cut surfaces a wide exposure was necessary It was essential to be careful with the traction because the musculo spiral nerve was so liable to be damaged As a first step in operation the

what bizarre spread of anaesthesia are due to the presence of old adhesions within the canal

In conclusion, I must agree with Mr Norman C Lake (*Journal*, February 6, p 297) that it is inadvisable to invoke a concept such as 'rachi resistance' to explain a failure to obtain a satisfactory spinal anaesthesia.—I am, etc,

New York, Feb 19 JOHN BURKE

Angioneurotic Oedema of the Tongue

SIR,—Not uncommonly acute swelling of the tongue and lips is caused by drugs of the antipyrine–phenacetin group—in certain people even a very small dose may be responsible.

The first case of the kind I saw was many years ago in an American patient to whom I gave a tablet of the above drugs. Almost immediately the tongue and lips became acutely swollen. The swelling subsided very soon without treatment. The patient allayed my anxiety by telling me that a few years previously in New York the same thing happened after presumably a somewhat similar headache tablet.—I am, etc,

London, S.W.1, March 6 REDMOND ROCHE

Intraperitoneal Haemorrhage from a Graafian Follicle

SIR,—I agree with Mr Leedham Green (*Journal*, March 6, p. 527) that this condition deserves better recognition in surgical and gynaecological textbooks in order to save 'unnecessary sacrifice of tube and ovary owing to confusion at operation with primary and secondary ovarian pregnancy.

Even in my short experience I have operated on two of these cases and I have seen two more operated on by Mr Woolfenden and Mr Silverstone at the Liverpool Royal Infirmary. These cases simulate acute appendicitis much more closely than an ectopic gestation owing to the absence of vaginal bleeding and a missed menstrual period; hence they are more often referred to a general surgeon than to a gynaecologist. I think this explains why the condition is not stressed in textbooks because gynaecologists should and usually do write the chapters on the ovary in the general surgical textbooks.

In the four cases I have seen the intraperitoneal haemorrhage was insufficient to cause the signs and symptoms of gross internal haemorrhage such as occurred in Gordon-Taylor's and Klein's cases. In all four the pain started exactly two weeks after the last menstrual period—that is the time that ovulation is believed to take place; this enabled me strongly to suspect the condition in one case before operation. In three of the cases the pain started as a low constant abdominal pain settling in the right iliac fossa, but in one case rectal pain and tenesmus were the first symptoms, presumably due to the filling of the pouch of Douglas.—I am, etc,

Liverpool 1, March 7 M. J. BENNETT JONES

SIR,—The recent correspondence in the *Journal* on the subject of intraperitoneal haemorrhage from a ruptured Graafian follicle giving rise to symptoms which were mistaken for an 'acute abdomen' tempts me to record a case I operated on in September 1936, which puzzled me a good deal at the time.

A single girl, aged 19, was admitted to hospital on August 25 with a five days' history of pain in the right iliac fossa, varying in intensity and pain on micturition. She continued to have pain while in hospital for some days and urinary investigations were being carried out. On the evening of September 3 she had a sudden acute attack of abdominal pain with marked tenderness and rigidity and hyperaesthesia in the lower part of the abdomen, more particularly on the right side. Rectal examination gave no information. She appeared very ill and had a raised pulse rate but no rise in temperature. The diagnosis of acute appendicitis was made and an operation decided upon.

At the operation through a paramedian incision the appendix was found to be normal and about half a pint of free blood and clot was present in the pouch of Douglas. On examination the right ovary was seen to be congested and a large Graafian follicle which was torn across was bleeding rapidly. The Graafian follicle was cut away and the bleeding area buried by suture with catgut. The appendix was removed and the abdomen closed. Subsequently she developed a urinary infection which cleared up under treatment.

One month later she was readmitted with further attacks of pain which her doctor described as being similar to those of right renal colic. Full examination including cystoscopy and ureteric catheterization revealed no abnormality. The patient was discharged and since then has been in good health.

Although I have not seen a similar condition before I find on inquiry among other surgeons that they have operated on similar cases and I do not think that the condition can be particularly rare. Fortunately this particular mistake in diagnosis is not one likely to lead to any permanent harm to the patient and the appendix can be removed at the operation; always a good prophylactic measure when laparotomy has been carried out and no gross pathological lesion found. In my case I found the haemorrhage could be quite easily controlled by infolding the ruptured 'cyst' by suture and it would seem to be unwarrantable to sacrifice the ovary in most cases of this kind.

My thanks are due to Mr Denham Pinnock under whose care this patient was in hospital for permission to record the case and for helpful criticism and advice.

—I am, etc,

London, W.1, March 4 J. C. NICHOLSON

Specific Antitoxins for Gonococcal Infections

SIR,—The treatment of gonorrhoea is too important for me to ignore Dr Anwyl-Davies's reply to my letter (*Journal*, February 20), and in this respect practical clinicians would be the better served if instead of apportioning praise to the pathologists and others concerned with such scrupulous precision Dr Anwyl-Davies would with equal precision elaborate and so clarify his own results.

In my letter I did not ask whether adjuvant treatment was employed. The term I used was orthodox treatment and I stated explicitly what this meant. However Dr Anwyl-Davies naively admits that some cases were 'treated along routine lines'—that is some cases had (presumably) irrigations and some form of massage—but with a conspicuous lack of precision fails to tell us which type of case had routine treatment and why, and which type of case was denied this and for what reason. To justify his omission Dr Anwyl-Davies (by implication) compares the routine treatment of gonorrhoea with throat sprays, cardiac stimulants and skilled nursing in the treatment of diphtheria and summarily disposes of the matter. He says: After all one does not rely on antitoxin in treating a case of diphtheria to the exclusion of throat sprays, cardiac stimulants and skilled nursing. My reply is—one does. It is in the absence of antitoxin or in its delayed use that cardiac stimulants are chiefly indicated. But this is not the point. If a clinical research were con

nerve should be exposed fully and retracted well out of the way. After describing bone-grafting of the femur—which he said was one of the biggest operations in surgery—and the tibia, he analysed the thirty-seven cases at the General Infirmary at Leeds over a ten-year period. The average age of the patients was 33. The number of operations carried out was drilling, three; reconstruction, two; grafting, thirty-five (of which twenty-five were autogenous grafts); and amputation, one.

Bone Plating

MR H. A. T. FAIRBANK expressed the view that delayed union was as common as it was twenty years ago. The causes were local and not general. He did not regard imperfect immobilization as the only cause, as some people would have them believe. Want of apposition of the fragments and deficient blood supply of one of them were causes in some instances. He was old enough to have seen the old fixation—not rigid, because the splints were not very good—without regard to anything else give place to mobilization and massage, and his feeling was that the latter procedure gave just as bad results as the former. Now they had gone back to realize that rigid immobilization was an essential feature, but with due regard to the functional use of the limb when this was possible without endangering immobilization. The cases one saw nowadays of delayed union and non-union were still far too often the result of early massage and movements of the adjacent joints. Another class of cases still to be seen were those treated by open operation without a sufficient number of screws being used for the bone plated and also without adequate external splintage. A plated fracture required just as much care in splintage, and for the same length of time, as a fracture which had not been operated on. Personally he could not help feeling that the pendulum had swung rather too far from open operation in earlier cases, which, after all, should give perfect results. Mal-position of the fragments was very important. He had seen cases which on being exposed three to five months after the injury showed practically no change whatever, or merely a suspicion of the rounding off of the sharp ends, but when the ends were put in position and plated there was no trouble about joining up. He shared Mr Moore's view that it was a mistake to let students leave hospital with the idea that skeletal traction was a routine method of obtaining extension when this was necessary. With regard to the femur it was a good plan to plate as well as graft. He had done this several times, and had no reason to regret it.

Vascular Supply

MR G. R. GIRDLESTONE said he himself had passed through two periods in dealing with cases of non-union. His change of mind or repentance dated from a trouble-some case of a healthy undergraduate with a fractured femur showing a very obstinate condition of non union. A great deal of splintage was done the patient underwent four operations, including plating and grafting and he was made to walk on a calliper, but for about two years the bone refused to unite. The secret in that case as he thought in other difficult cases, was the factor of blood supply. When one or both ends of the bone were anaemic a difficult condition was presented. In a case of obstinate non union it might be best to stop worrying it for the time being, to fit up some splint which allowed ambulatory activity if a lower limb, or action of the hand if an upper, and to tell the patient to go away and forget about it and come back in six or nine months. The principles of treatment were (1) immobilization without circumferential pressure, (2) end-to-end intermittent strain, (3) a good blood supply. The last was the one thing that would save amputations and failures. It might be a necessary part of the operation to provide the blood supply with a path. At Oxford a point had been made of never raising the ends of the bone from their vascular bed in any operation for non-union. Sclerosed fibrous tissue was taken out and channels of vascular supply opened up. Grafting was done by the inlay method, by osteo-periosteal grafts, and by chip grafts. But the most important thing of all was to open up the blood channels.

General Discussion

MR K. H. PRIDIE said that there was an inverse ratio between the cross section of bone and the time taken to unite. In transverse fractures there was a call for patience and for immobilization for sufficient time until consolidation occurred. In 80 or 90 per cent. of tibial fractures he put on traction by means of Kirschner wire and reduced it and the wire was out in twenty minutes. He had never used a bone plate, he did not think it necessary. In the case of a young person with a fracture where there was good apposition but non union at the end of three months he thought matters should be anticipated and multiple drilling be done through a minute tenotomy wound, putting the patient in adequate plaster, which must come up to the tuberosity of the ischium, for a further three months. He had found that he could get good union in that way.

MR MCCRAE AITKEN said that the causes of failure to unite were non-apposition and movement, and the worst movement was rotation. The failure to unite was seen most often in the transverse fracture, especially in the humerus when there was frequently a stiff elbow as well, and in the lower third of the tibia because the foot had not been properly fixed and the astragalus inverted. MR ERIC LLOYD described half a dozen cases of non union. One was in a man of 20, in whom there had been non union for two and a half years. He carried out the usual drilling operation as described by Bohler, and seven months after operation the bone was clinically and radiologically united. Another case was a man of 24 with non union where with 35 lb. of skeletal traction for five weeks. He underwent the same operation and walked next day in his plaster, and four months later there was union and the plaster was discarded.

MR B. H. BURNS had been unsuccessful with wire. Whenever he had put wire into a fracture he had always noticed that in the neighbourhood of the wire non union occurred. He had been startled by MR FAIRBANK'S advocacy of steel plates. In his experience, in an area where these had been put on union did not take place and where union did take place eventually it was in an area furthest removed from the plate. MR NOEL ST J. BUXTON referred to the after-history of twenty four cases of non-union or delayed union of tibia and fibula which he had dealt with in eight years. He had circularized the patients and had heard from the greater number. All had exactly the same operation—a bone graft, the ends exposed, sclerosed bone cut away—and he never used any wire or plate. Not one of the patients had had any treatment since the graft except splintage. All were satisfied, though two complained of bad ankles.

DR DUNCAN WHITE believed that ununited fractures now were more common than twenty years ago. Absolute and complete immobilization had something to do with it. The question of excessive x-ray examination as a contributory cause might be dismissed. Even the forty five films in four weeks mentioned by the opener of the discussion could have had no bearing on the question of union. MR WHITCHURCH HOWELL said that there were a certain number of cases in which no union would take place until an operation was done. These were often due to interposition of fibrous tissue perhaps periosteal, between the ends. No amount of drilling would cure this, and a massive, wide, and long bone graft, with stripping of periosteum up and down the shaft to a very considerable extent with free eversion of the two ends of the bone, would give the best result. Lately he had been using a much wider and deeper saw, specially made, and his results had considerably improved. Metal must be used sometimes, but the more he saw of these cases the less he used it. Occasionally it was necessary for the

ducted in the treatment of diphtheria and a new therapy used, one would necessarily want to know which cases were cured with the new therapy alone and which needed cardiac stimulants or any other treatment, and why. The cases would then have to be subjected to careful analysis before results of any value could be published. Throat sprays are very comforting, so are bowls of roses. Both are of equal efficacy if one "does not rely on antitoxin" in diphtheria. With reference to skilled nursing, does Dr Anwyl-Davies imply that some of his cases "having no other treatment" had no skilled nursing? In asking this and other questions I am not indulging in idle persiflage, but am attempting to deal logically not only with the data in his reply but with certain desiderata of paramount importance omitted from it. If my criticism is destructive it is because of my deep interest in gonorrhoeal research in particular, and in scientific method as applied to it.

For an experienced clinician using an entirely new method of treatment to state (and then only after being questioned on the matter) that "some of the cases quoted had no other treatment, others were treated along routine lines," and to leave it at that, reduces clinical research to such depths as to remove it irreparably from the realms of scientific method. Thus with regard to the antitoxin it may or may not possess the value already attached to it. All one can say so far is that the results obtained from its clinical application are meaningless.—I am, etc.,

Diathermy for Cervicitis

SIR,—In cases of "infective arthritis" investigations to ascertain the focus of infection are made, and usually the tonsils or teeth are blamed. Rarely is the cervix or prostate investigated, yet strangely enough it would appear that these form the commonest site of infection. For many years now from just after the war, when Dr. C. A. Robinson produced his classic work on the treatment of cervicitis by means of diathermy, the electrical department of one of the large teaching hospitals of London (where his pioneer work was carried out) has been treating large numbers of these cases with unfailing success.

Many members of the profession are unaware of the prevalence of these cases and of the method of treatment, and those who do know of this form of therapy seem to think that it is confined to the treatment of gonorrhoea. This is not so. There appear to be four categories into which cervicitis can be divided: (1) gonococcal, (2) post-partum, (3) menopausal, (4) general. The symptoms of this condition form a syndrome which Robinson worked out as follows: first, vaginal discharge, followed by low backache, depression, toxaemia (bruising easily, etc.), and finally arthritis. On examination the backache can be produced and made more severe by pushing the cervix upwards but not by putting the patient through the movements of the sacro-iliac joints. The speculum shows erosion of the cervix and discharge therefrom in varying degree according to the length of duration of the infection.

Treatment by means of general pelvic and cervical diathermy twice weekly for about three months is usually sufficient to clear up this infection entirely. Over a period of many years it has been found that this prolonged treatment is more certain than the more rapid methods of cauterization or coagulation. I have been treating large numbers of these patients for some years now, and I feel from the results that a letter on this condition and its treatment is not untimely.—I am, etc.,

London, W.1, March 5 ROBERT LEAVER

Prevention of Silicosis

SIR,—I ought to answer Mr. McLachlan's queries in your issue of February 13 (p. 361) concerning evidence as to the adsorptive action of coal dust.

If a few grammes of coal dust in a boiling tube are just wetted with alcohol and then well shaken up with, say, 15 c.cm. of a concentrated ruby solution of iodine in water the solution will rapidly be almost completely decolorized (cf. Davis, 1911; Rideal, 1926), the iodine being adsorbed by the coal dust particles. Soot will adsorb iodine in the same way and both coal dust and soot will decolorize industrial methyl ated spirit by adsorbing the methyl violet dye. I first observed this adsorptive effect in 1924, and silica dust would probably behave similarly, though I have not yet tried it. This might help to indicate to Dr. Craddock how iodine may be introduced into the lungs in connexion with his letter in your issue of February 20.

Recapitulating this adsorption of iodine by coal dust, and combining it with Dr. J. Goodfellow's experiments with iodine, described in your issue of February 6, a definite procedure becomes outlined whereby the value or otherwise, of iodine application as a preventive of silicosis may be ascertained. This is as follows:

(*a*) Some coal mine or mines, where silicosis is most prevalent—for example, South Wales anthracite mines—should be chosen for experiments.

(*b*) In a circumscribed portion of the workings the atmosphere should be persistently and consistently sprayed with an atomized solution of iodine, so that iodine would be available for adsorption by the dispersed coal and other particles before they passed into the lungs.

(*c*) The dispersed dust should be periodically collected and studied, and analysed to ascertain that iodine is being adsorbed by the particles.

(*d*) Examination should be made and records should be kept of the incidence of silicosis among workers chiefly or wholly engaged in the circumscribed region, as compared with its incidence among other workers immune from iodine spraying. Spraying should be generalized immediately if positive benefits were detected.

The introduction of iodine, since it would freshen the air and give it a sea tang, would hardly be resented by workers, valuable results might be obtained relatively quickly, and if a positive advantage were realized iodization of all coal mines and other industries subject to silicosis could quickly follow. Thus silicosis might be stamped out long before the general prevention of dust formation is achieved and many lives might be thus saved.

Since iodine is very volatile it might be found preferable, to prevent over-moistening the atmosphere, to merely volatilize it into the atmosphere, if the vapour were found to be readily adsorbed, extent of vaporization being controlled by the temperature of the iodine. Whatever silicosis theory were proved or disproved is, of course, of quite incidental importance beside the necessity of relieving sufferers, and such bodies as the King Edward VII Welsh National Memorial Association, the South Wales Miners' Federation, or the Health Advisory Committee of the Mines Department ought surely to be keen to have carried out such a positive, possibly preventive, and relatively simple research.

In fact, it might be better to institute similar research at once in all silicosis-producing industries, in view of wide national and current Parliamentary interest in silicosis and the urgency of the problem, either through the Home Office or the Department of Scientific and Industrial Research.—I am, etc.,

strength and embarking on intensive scientific research, which was always so near to his heart. He saw his old hospital completely rebuilt, he read with pride the scientific papers published by workers in the research laboratories which he built and which bear his name, and he saw the completion of the exquisite hospital chapel which had always been his special care. He was well enough last year to attend the ceremonies in connexion with the opening of the new Middlesex Hospital and the centenary of the medical school and listened with pride to the tributes to the large part he had played in bringing the hospital and medical school to their present proud position.

Many of Bland Sutton's friends marvelled that with his apparently frail physique he should have been able to lead such an active life and yet be spared to live to over eighty. And it is indeed remarkable when we call to mind that in order to satisfy his insatiable curiosity and in order to observe many of the inhabitants of zoological collections in their natural haunts he travelled all over the world. He ventured into Arctic snows and under tropical suns, and even undertook a hunting expedition to East Africa. His urge was to study men, beasts, fishes, birds and plants, and he took little interest in the hunting except to secure something for the next meal. It was *not my privilege to know him until twenty eight years ago* when his reputation was world wide not only as an operating surgeon but for his work and writings on anatomy, pathology and surgery. The broad biological outlook which he maintained from first to last has led to his being recognized as the nearest approach to his hero the immortal John Hunter.

Bland Sutton was a prolific writer and lecturer. He always had something to set forth and had the gift of setting it forth in spoken or written words. Writing and lecturing were a joy to him, and he spared no pains or expense in making his lectures and writings attractive and readable. His lectures were generously illustrated by diagrams, his books were lavishly illustrated by the most exquisite wood engravings. He had no use for lantern slides for his lectures or for photographs for his books. He maintained that the points which the lecturer or writer wished to emphasize and expound could not be made clear in photographs. He was never afraid to admit that he had been in the wrong which he regarded as but saying that he was wiser to-day than he had been yesterday. I have surprised him in his study at his beautiful Brook Street house kneeling before the fire watching the flames consume copies of one of his books. On asking him the reason for the holocaust he replied that he was no longer willing to propagate error.

In the more intimate sphere many will recall with gratitude and admiration the princely hospitality he offered both in his private capacity and officially when holding office as president—whether of a Branch of the British Medical Association, the Medical Society of London, the Royal Society of Medicine, the Royal College of Surgeons, the Association of Surgeons, or an International Congress on Surgery or Cancer. His interests were wide and he had a large circle of friends. At his house besides men of science one met leaders in all walks of life: artists like Frampton and John Collier, playwrights like Pinero, Sutro and Henry Arthur Jones, players like Charles Wyndham and Fred Terry, Julia Neilson, Phyllis Neilson-Terry, and Irene Vanbrugh, authors like Kipling, judges like Sir Samuel Evans, journalists like Gwynne of the *Morning Post*—all his close and intimate friends. In all his activities he had the staunch and loyal support of Lady Bland Sutton who has tended him so devotedly in his later years. They were indeed happy complementary to each other and real helpmeets in every way.

Bland Sutton was staunch in friendship. His love of entertaining found expression in his later years in inviting a few intimate friends to his lovely house on the cliffs at Kingsdown where he delighted in the activities of the Channel, the great variety of birds in the bird sanctuary he created, the marvels of the heavens, and the joys of his unique garden. In these surroundings he was indeed a good companion and hardly a minute would pass without his imparting some illuminating item of information. I doubt not that I voice the feelings of all his friends when I express real and heartfelt gratitude that this very remarkable man and lovable personality passed our way.

Mr VICTOR BONNEY writes:

I desire to add my tribute to the memory of the great surgeon and remarkable man who has just passed away.

My memories of Sir John Bland-Sutton extend back to 1891 when I entered the Middlesex Hospital Medical School. Mr Sutton as he was then called was the junior assistant surgeon and senior demonstrator of anatomy. He was a small pale man with a dark moustache. Among us younger students he was chiefly known as a brilliant teacher of anatomy, but there was talk too of remarkable operative dexterity and courage. Our medical education had not then proceeded far enough to appreciate or even to know about the wealth of anatomical and pathological work which he had already accomplished. In those days a junior assistant surgeon had very little opportunity to distinguish himself in the operating theatre except during the holiday months, and it was not until he was appointed surgeon to Chelsea Hospital for Women in 1895 that Sutton got his chance.

It was on his advice that in 1898 I went to Chelsea as resident officer and by that time he was the star turn there. The surgical treatment of uterine fibroids was then in process of development against considerable opposition from certain quarters. Assisted by the late Arthur Giles Sutton operated every Monday afternoon, and the theatre was crowded with surgeons from all parts of the world. He had a remarkable power of infusing enthusiasm into those who served under him, and all of us worked with a will to make the operations go off as perfectly as possible. It was the beginning of that "team work" which is now an established practice in all first-class surgical centres. In the face of his brilliant dexterity and successful results the opposition to the surgical treatment of fibroids rapidly died down, and to him more than to any other surgeon in this country is due the credit of changing professional opinion in the matter of these tumours. But he did more than this for he raised the status of abdomino-pelvic surgery *out of the narrow rut of specialism in which it threatened to stick* and created the gynaecological surgeon in place of the gynaecologist.

In appraising his place as a great operator it is necessary to have regard to the state of surgery at the time when he entered the calling. The new territory which Lister's discovery had opened to surgeons was being cautiously explored; antisepsis was still in the carbolic spray stage; steam sterilization was unknown; catgut was unsafe; silk, silkworm gut, and silver wire were the popular ligature materials; the most advanced surgical attire was a carbolized mackintosh apron over ordinary clothes; and the idea of rubber gloves was nearly twenty years distant. Operating theatres were poorly equipped and a large proportion of surgical operations were carried out in the houses of the patients under very disadvantageous conditions. There was no system and very little co-

ordination As a result surgery with very few exceptions was laborious, slow, and timid Bland-Sutton perceived that for operative work to be reasonably safe under such conditions simplicity and speed were essential, and his results justified his opinion He reduced the number of instruments he used to the very minimum, six pairs of Spencer Wells forceps, a dissecting forceps, a pair of scissors, a scalpel, half a dozen needles, and a couple of reels of silk thread sufficing him for any operation He used antiseptic solutions very sparingly, especially on his own hands, maintaining, much in advance of his time, that they merely made the skin rough and more prone to harbour infection There can be no doubt that at the outset of his career his views and practice as regards operating were largely influenced by Lawson Tait, of whom he always spoke with great respect He was exceedingly quick and dexterous yet light-handed, and his determinations were taken with unfailing rapidity and carried out with unfaltering resolution To the last day of his surgical life tedious, prolonged operations had no interest for him, and indeed he never entered upon them

Those who are old enough to know, and those who though young can yet visualize, the operating theatre of the 'eighties can appreciate how much our art is indebted to him Since this present century began surgery has undergone a profound and advantageous elaboration, purchased, however, by the loss to the surgeon of some of that self-reliance which was so striking in Bland-Sutton at the operating table The conditions under which surgeons now work mask this loss, but there are occasions still when the fate of the patient depends on this great quality alone, and for that emergency every surgeon should keep within himself something of the spirit of Bland-Sutton

Professor GREY TURNER writes

The death of Sir John Bland-Sutton removes a most stimulating personality who, by his writings and by his adroit work in the operating theatre, did a great deal to encourage the younger generation of surgeons of his time

I remember that it was away back in the late 'nineties in my undergraduate days that Professor Frederick Page of Newcastle-on-Tyne first told me about Bland-Sutton and recommended that I should read his book on tumours Of course it was true that even at an earlier stage I had read his little book on ligaments, which opened up a new world to us in anatomy and made us think of the possibilities suggested by the novel and wider outlook that he put forward in his interpretation of what one had previously looked upon as rather dull things The book on tumours was at once arresting and fascinating, and I never read any story with greater avidity About that time he kept up a correspondence with Frederick Page concerning the treatment of the placenta in advanced cases of ectopic gestation, and I remember with what glee we were told about those letters and how much we looked forward to hearing about what was really a mild controversy At that time and for some years afterwards Mr Sutton, as he then was, contributed regularly to the popular *Clinical Journal*, and as I recall those days it brings to my mind the eager anticipation with which the appearance of the journal on Friday nights was awaited just in the hope that it would contain something from his facile pen

In 1900 as a mere fledgling I came to look round London armed with introductions from my old teacher Rutherford Morison and I shall never forget the warm reception which Sutton gave me He not only invited me to see his work at Chelsea, but he used to ask me to turn up at his house and to accompany him in his victoria with a pair of beautiful grey horses, and the drive through the park over to Chelsea was a never-to be forgotten experience His conversation was like his writings, except that he used more of those quips which the writer of the memoir in the *Times* has picked out as characteristic They would be difficult to reproduce in writing, but they always conveyed some lesson, and I remember many of them as if they had just been uttered yesterday At that time he always had good operation lists, and it was a great treat to be a witness of his dexterity in the abdomen His London accent, of which I am quite sure he was a little proud, seemed to heighten the point of many of his remarks I remember on one occasion he told me that he had been born within the sound of Bow Bells, but he added, "Thank God within easy reach of the green fields and the country" But visits to his theatre did not represent the whole of his thoughtfulness to an extreme junior, for he invited me to his house, then in Queen Anne Street, and later on to Brook Street, where it was a great privilege to be a guest at some of the wonderful entertainments which were there staged

His enthusiasm and reverence for Hunter were very remarkable, as is well illustrated by the following incident Some years ago I was able to purchase three of John Hunter's letters, and as I thought that one of them would be of particular interest to Sutton I sent him a transcript By return came one of his characteristic notes in a clear, legible hand telling me how much obliged he was for the chance of being made familiar with the Hunterian letter, and he added, "When you come to town be sure to bring it and show it to me, *but don't trust it to the post*"

Later I saw a good deal of his work at Middlesex, and each time there was something which impressed the visit on my mind and made me feel that it had been worth while As others have said, his technique perhaps lacked finesse and in the early days of the rubber glove he certainly treated them with a certain amount of levity, but nevertheless he was wonderfully skilful and most adept in emergency, and I know that his results were remarkable

I feel very grateful to him not only for his stimulating friendship over a long period of years but for his help in other ways He it was who encouraged me to take an interest in the College of Surgeons and to go up for the Council, and I am quite sure that it was a very genuine pleasure to him when I was finally elected He loved the Hunterian Museum and everything to do with it, and his work on the Museum Committee was a great joy When acting in that capacity he took the trouble to write me a delightful letter of thanks for some specimens I had presented Such considerate kindness, shown on so many occasions, revealed the real character of the man and is not easily forgotten

[The photograph reproduced is by Elliott and Fry Ltd]

R F C LEITH, M B, F R C P ED

The death took place, at his residence in North Berwick on December 14th, of Emeritus Professor Robert Fraser Calder Leith, who retired in 1919 from the chair of pathology and bacteriology in the University of Birmingham He was born in 1854, and after graduating M A with honours at the University of Edinburgh in 1882 and B Sc in 1883, he took up the study of medicine and graduated M B, C M with first class honours in 1885 He had also for a short time studied for the Scottish Bar, but abandoned a career in law for one in medicine During his period as an undergraduate he took much interest in student affairs, and was president of he

Inhalational Therapy

SIR—The correspondence on inhalational therapy has interested me by reason of a recent experience of the Duke Fingard treatment The history of events is as follows

After answering an advertisement in a Sunday paper my patient went to London The treatment and apparatus required were described to him and he was referred for examination to a medical man, who wrote to me on November 11 1936 Prior to the London visit my patient had not informed me of his intentions but between his return and the receipt of the doctor's letter on November 12 the patient sent for me to explain what was to happen He had bought a machine but owing to pressure on production it was not yet installed in his house The machine he informed me was somewhat costly but the charge for the machine included no recompense to Mr Fingard and it was left to the patient to make a payment of an unstated amount after he had received benefit from the treatment At the same time he heard of a celebrated film star who had been cured by the treatment and of a payment of a thousand pounds The medicaments cost my patient between £2 and £3 a week

He started treatment in November and soon became able to spend the whole of the night in a medicated atmosphere He began to feel much improved in health the cough and expectoration being much diminished He was able to sleep and his capacity for exertion increased

I visited the house some two or three weeks after treatment began and had a demonstration of the method Personally I did not find the vapour pleasant smelling and I took a considerable odour home with me The vapour was not irritating but was capable of removing the finish from all furniture and woodwork with which it came in contact As the vapours pervaded the whole of the house these effects were not limited to the bedroom in which treatment was provided

On January 19 1937 I was called to see the patient who had contracted an acute bronchitis diffuse and deep seated For two days he was able to expectorate some muco purulent sputum but then in spite of stimulant expectorants he became less and less capable of clearing his chest and died on January 22 1937 From previous experience of my patient I should have said he was likely to live another fifteen years

I think it is important to record instances of this kind when a correspondent (*Journal* February 13, p 360) mentioning his experience of the treatment, writes "I have not seen any ill effects even after a prolonged inhalation of this vapour My conclusion is that it is unsafe for a patient to spend his nights in such a warm, medicated atmosphere and to go out by day into the rigours of our climate—I am, etc,

Runcorn March 2 N A' BOSWELL

Hire Purchase Research

SIR—I have read with much interest your article under the heading A Disclaimer in the *British Medical Journal* of February 13, as my society, the London and Counties Medical Protection Society has for a considerable period dealt with a number of complaints by its members against the Consolidated World Research Society Ltd Not only has it advised such members to discontinue subscriptions to the Consolidated World Research Society Ltd, but has offered to defend them should proceedings be brought and in collaboration with its solicitors has repeatedly invited the Consolidated World Research Society to take proceedings but in no instance has this challenge been accepted This challenge is still outstanding and will be accepted whole heartedly should the opportunity occur—I am, etc,

London W C 2 March 2 Secretary

Obituary

ARCHIBALD FAIRLIE, M D

Late President North of England Branch B.M A

We regret to record the death on February 28 of Dr Archibald Fairlie of Blyth at the age of 72 after a very short illness Born at Killearn he received his education in the University of Glasgow, graduating M A M B C M in 1889 and proceeding M D in 1900 His first appointments included those of resident assistant to the Western Infirmary and house surgeon to the maternity hospital in that city Later he was assistant in a practice at Dunfermline and went to Bebside in 1894 adding to the latter extended professional work in Blyth from 1908 onwards He was also medical officer to the Thomas Knight Memorial Hospital at Blyth and a trustee and a member of its general committee taking a prominent part in the expansion and reorganization of the hospital a few years ago For many years he had been chairman of the Bebside Nursing Association His long continued and devoted work on behalf of the St John Ambulance Association led to his being created a Serving Brother of the Order of St John of Jerusalem

Dr Fairlie was elected a member of the British Medical Association in 1895 and was chairman of the Blyth Division from 1927 to 1928 He was president of the North of England Branch from 1933 to 1934 and during this period his son Dr C F Fairlie was elected chairman of the Blyth Division a coincidence which is probably of very rare occurrence if not unique Dr A Fairlie had represented the Blyth and Morpeth Divisions at two recent annual meetings of the British Medical Association He was a founder member and a past president of the Blyth Rotary Club a member of the Whitley Bay St Andrew's Society and of the Blyth Literature and Scientific Society and a Freemason He was noted as an authority on Scottish Border and Roman history and took an active part in the proceedings of the Newcastle Society of Antiquaries He devoted much time to public life—he was a justice of the peace and had been a representative of the Bebside ward on Blyth Urban Council His wife died eighteen years ago and he is survived by two sons both of whom are in the medical profession

A colleague (W C L) writes Dr Fairlie was known and respected by all for his honesty of purpose and equally honest and faithful conduct towards his fellow practitioners and fellow citizens He won the respect and confidence of all who came into contact with him by his thoughtful appreciation of their problems his astonishing grasp of detail his careful marshalling of facts and his practical opinions on men and matters He never hesitated to give of his talents and his time to the welfare of the community He had a high sense of his duty as a citizen and his death has inflicted a great loss on the medical profession He was keenly interested in medicine took an active part in the work of the British Medical Association and gave freely of his time to the betterment of professional practice On the scientific side of medicine he was equally keen and his work was invariably sound and accurate He was quick to learn and adopt new and useful methods of treatment Great indeed is the sense of personal loss among those of his fellow practitioners who came into contact with him

Dr Theodore Craig writes By the death of Archibald Fairlie Blyth has lost its oldest most erudite and generally

ing, four of pachymeningitis and extradural abscess, and three of cavernous thrombosis Most of the patients were young, as many as twenty two being under the age of 30 The youngest patient was only 6 months old Bacteriological examinations in nineteen cases revealed the commoner pathogenic germs In twenty one cases there were ocular symptoms, which in sixteen cases were indicative of inflammation of the orbit In five cases the inflammation had extended to the eyebrows and the conjunctivae In twenty cases the source of the intracranial inflammation was frontal sinusitis, and there was not one case in which the maxillary sinuses were to blame There was only one case in which the intracranial disease was due to a purely chronic sinusitis, in all the other cases the primary focus represented an acute condition, with or without a history of chronic disease earlier In as many as thirteen cases the primary lesion was limited to a single nasal sinus Recovery occurred in ten cases With regard to treatment the author considers a pleocytosis an indication for radical treatment of the primary focus and an exploratory exposure of the dura Should pachymeningitis be found the exploratory exposure should be so extensive that healthy dura is visible at the periphery of the field of operation

201 Infections of Accessory Sinuses

H. LOEBELL (*Med Welt* January 2, 1937, p 10) draws attention to the fact that the nose and the nasal accessory sinuses must always be regarded together Of the 45 c.cm air space in the sinuses 15 c.cm are in the maxillary sinus The common cold is the aetiological factor in 80 per cent of inflammatory conditions of the accessory sinuses, 10 per cent. of cases of maxillary sinus infection are due to dental disease Osteomyelitis and trauma are rare aetiological factors Inflammation may be serous, polypal, purulent, or necrotic Patients complain of pain in the frontal region more commonly than in the maxillary region, of lassitude anorexia, running cold in the head, difficulty in breathing through the nose and shooting pains in the ear Headache usually occurs in the morning on rising and passes off in the afternoon The patient often has an unnaturally resonant voice Eczema of one nostril is almost pathognomonic of maxillary sinus infection in the adult Examination of the nasal discharge is important Rhinoscopy and diaphanoscopy are valuable methods, but care must be taken in making deductions from the findings of the latter Puncture of the maxillary sinus, which is then washed out, may reveal pus An *x* ray of the sinus immediately after puncture and filling with iodine solution may be helpful in estimating the extent of disease In cases of chronic headache syphilis and anomalies of refraction must be excluded In the acutely inflammatory stage the patient should be treated on general principles Intensive local treatment is contraindicated Analgesics, baths heat and inhalations suffice Spa treatment often gives relief when all other conservative measures have failed In a small percentage of cases radical operation is necessary With modern technique operations on the accessory sinuses may be performed under local anaesthesia A good cosmetic result can be assured

202 Endolaryngeal Cancer

W DE BRUIN VAN RAAMSDONK and A C DE BRUIN (*Nederl Tijdschr Geneesk* January 9, 1937, p 112) record their observations on ten cases of endolaryngeal cancer which after cure by operation or *x* ray therapy underwent treatment for the voice The ages of the patients when they came under treatment ranged from 40 to 77 In all the operable cases treatment consisted in laryngo fissure and electrocoagulation of the tumour when one or both vocal cords were involved Although a complete recovery of voice was not obtained, application of faradic and galvanic currents during periods ranging from six months to a year gave fairly satisfactory results

Obstetrics and Gynaecology

203 Intracavitary Uterine Polypi

According to P MOCQUOT and R PALMER (*Paris med*, December 19, 1936, p 462) intracavitary polypi of the uterus can now be more easily diagnosed by modern methods, and are therefore suitable for conservative treatment Ordinary clinical signs and symptoms only permit suspicion of the existence of a polyp the classical procedures of intra uterine exploration are often inconclusive, and the polypus may elude either the curette or the finger Lipiodol hysterography is the most valuable means of diagnosis it must be done, however, in the absence of haemorrhage or infection and with manometric control, so that the pressure remains less than 4 cm of mercury Both mucous and fibroid polypi give the picture of a rounded clear cut lacuna their distinction from one another often depends on an oblique (three quarters) *x* ray picture Hysteroscopy by Segond's instrument is a valuable auxiliary The diagnosis of the nature of the polypus in the cavum uteri is dependent chiefly on its size A polypus of less size than a nut is nearly always mucous,' in combination with hormonic ovarian metropathy one larger than a nut is nearly always a submucous fibroid The mucous polypus, once it has been located, can usually be removed with ease by means of the curette The fibroid polypus is often found as a single tumour, and in young women it then calls for a conservative operation—hysterotomy This may be done by the abdominal route in the absence of infection If there is infection and if the local conditions are favourable (for example, wide supple vagina and mobile uterus) vaginal hysterotomy after anterior colpotomy may be successful Hysterectomy should be done when called for by an associated lesion The operation specimen should be carefully examined a 'mucous polypus' may be an early carcinoma and a fibrous polypus' an adenomyosis

204 Radiotherapy for Uterine Fibromata

SIMONE LABORDE and H SAILLANT (*Bull Soc Obstet Gynec Paris* November, 1936, p 644) state that of 303 patients with uterine fibromata coming during 1922–35 to the gynaecological department of the Paris Cancer Institute about 130 have been referred for operation twenty five given radium and ninety one treated by *x* radiation, other cases have been treated by medical means or (more satisfactorily) by diathermy of the pituitary As indications for operation they give very large fibromata, single or pedunculated fibromata which are suitable for myomectomy and complicated or calcified fibromata Surgical treatment is called for when there is any possibility of diagnostic confusion with pregnancy, ovarian tumour, or cancer of the corpus uteri Radium treatment was used when the size of the uterus was that of two and a half to three and a half months pregnancy, it was applied in the vagina in seven, in the uterus in seventeen, cases In all the haemorrhages ceased and the fibroma diminished in size A climacteric followed in the cases in which this was desired In four women aged 31 to 42 the menses became normal after being suspended for from a few months to two years and one of these gave birth to a healthy infant *X* radiation was, as a rule, given when the womb was the size of three to six months pregnancy fractional doses from two to four fields were chosen varying with the age and obesity of the patient Suppression of haemorrhage and slow regression of the fibroma were invariably attained, and the menstrual suppression was temporary in only two out of sixty who could be traced Radium by virtue of its quicker action is better for cases of abundant bleeding but *x* radiation appears to have been chosen in the majority of the series because most patients preferred out patient to in patient treatment Laborde and Saillant have found no case in which radiotherapy has led to malignant degeneration of a fibroma.

beloved physician His was essentially a scholarly mind with a fund of knowledge on innumerable subjects apart from medicine and surgery Always a shy and unassuming gentleman Fairlie never sought honour or advertisement, yet no doctor in Northumberland has been the recipient of more honours than he An extraordinarily lovable man, who enjoyed the trust of his patients and the esteem of all his colleagues, Fairlie was never in a hurry, never flustered, and never in the least degree irritable, yet he contrived to discharge the duties of a busy general practitioner with the utmost efficiency and still found time to interest himself in a myriad outside directions I think he was the most unselfish doctor that I have ever known, generous to a degree He was associated with every charitable and benevolent work in the Blyth area, but only the recipients of his charity were aware of his good works Some fifteen years ago the whole of the doctors in Northumberland and Durham combined to present Professor Rutherford Morison with a portrait in oils as a mark of our general esteem Rutherford Morison is still with us and still carrying on good work in his evening hours, but at the presentation meeting he was visibly affected by the affection and esteem shown by his fellow practitioners He looked around the great hall of the Durham Medical College trying to find words to express his feelings, and he happened to see Fairlie He said how deeply he felt the honour which we had done him, and then added "I am glad to see my old friend Fairlie with us to-day We of the staff of the Newcastle Infirmary always feel that when Fairlie sends us a patient we have to put on our 'thinking-caps' Fairlie never sends a patient to the Infirmary unless he feels that our best efforts are required, and his diagnosis is always correct" Mention must be made of his unfailing work for the British Medical Association and for the Northumberland Local Medical and Panel Committee He rarely missed a meeting and very rarely spoke, but when he did express an opinion it was backed by a mass of real knowledge which was invaluable to his colleagues His presidential address to the Newcastle and Northern Counties Medical Society last year was a masterpiece of carefully compiled facts and figures concerning the origin and development of the voluntary hospitals This lecture is carefully preserved in the archives of the society and will be most valuable to us as a ready source of exact information upon voluntary hospital matters

The late Dr ROBERT JAMES DICK of Morven Dartford Road Sevenoaks, was born on December 15, 1875, at Dunbar, East Lothian, son of a schoolmaster He was educated at George Watson's School Edinburgh, and Edinburgh University, and graduated M B, Ch B in 1898, proceeding M D in 1910 He came south after qualifying, and a few years later settled at Sevenoaks In 1917–18 he served with the R A M C on a hospital train in France In May 1936, his health broke down, and he passed peacefully away on February 23 at Nuffield House, Guy's Hospital, after a long illness He leaves a widow, one daughter and two sons The following appreciation has been written by a colleague, Dr J Finlay Alexander Robert James Dick's first introduction to Sevenoaks, where he practised for over thirty five years, came through acting as locum there When a partner was wanted in the firm which he eventually joined the doctor for whom he had worked introduced Dick This I think, shows the kindly feeling that his colleagues had for him and it has existed ever since he came to the neighbourhood He was on friendly terms with all of them, and his opinion on controversial matters was always listened to with the attention it deserved He formed his opinions after consideration and thought, and when he had made up his mind he stuck to them This same consideration was also a characteristic of his work He gave much thought to his cases, and when he had any patient seriously ill this was reflected in his worried mood He was as careful and unhurried with his poorer patients as with the more affluent, and he was respected and loved by them Many could tell tales of the trouble he took over details of their illnesses and the kindness which they received He was a reader and interested in music, and had a great love of beautiful country His holiday was preferably taken in some out of-the way village, and remained a joy to him throughout the year, and his dry humour made him acceptable, whether he went north or south His long illness he bore patiently, and his friends will feel glad for his sake that the end came suddenly and unexpectedly, at a time when he was less worried about his illness and in a cheerful frame of mind

The following well-known foreign medical men have recently died Dr OSKAR KLOTZ, professor of pathology and bacteriology at the Toronto University Faculty of Medicine, aged 58, Dr WILLIAMS MCKIM MARRIOTT, dean and professor of research medicine at the University of California Medical School and author of a work on infant nutrition, aged 51.

Universities and Colleges

UNIVERSITY OF OXFORD

Congregation on March 2 approved a decree proposed by Sir Farquhar Buzzard, Regius Professor of Medicine, authorizing a special allowance of £500 a year to any Nuffield professor who undertakes not to retain fees accruing to him by reason of attendance on patients in hospitals associated with the Nuffield scheme Sir Farquhar Buzzard explained that the object was to permit any professor who did not wish to practise for gain to compound for any fees for this annual payment His service would naturally be at the disposal of patients and colleagues in cases of special interest

An election of two members of the Board of the Faculty of Medicine vice Mr H S Souttar and Dr O L V S de Wesselow, will be held on June 2, the members elected will come into office on the first day of Michaelmas Term 1937, and will hold office for two years The General Medical Electorate consists of all Oxford graduates in medicine who are members of Convocation The Board of the Faculty of Medicine includes four members elected by the General Medical Electorate, who must be members of that body, and of whom three at least must be persons engaged in teaching one or more of the clinical subjects of the Faculty Nominations of duly qualified candidates for election will be received by the Secretary of Faculties at the University Registry up to 10 a m on May 12 Each nomination must be signed by six members of the General Medical Electorate, and no candidate will be eligible whose nomination has not been received by that date

C " be held for the purpose of granting
gra degrees on the following days at 2 30
p r 29, Saturday June 5, Thursday, June 24, Saturday, July 17, Saturday, July 31 Names of candidates must be entered at the University Registry Clarendon Building Broad Street, not later than noon of the second day before the degree day

H M Sinclair, M A, B M, B Sc Lecturer in Physiology and Biochemistry in University College has been elected to a Fellowship on the foundation of Dr John Radcliffe

In our advertisement columns this week the University of Oxford invites applications for the whole time post of Assistant Director of Pathology under Lord Nuffield's benefaction The stipend offered is £1,000 a year and the work must be carried out at Radcliffe Infirmary Applications should reach the Secretary of Faculties, University Registry, Oxford, by *April 26*

UNIVERSITY OF CAMBRIDGE

Edgar Douglas Adrian M D, F R C P, F R S, Fellow of Trinity College, has been elected to succeed Sir Joseph Barcroft, F R S, in the Chair of Physiology from October 1

205 Colposcopy

H HINSELMANN (*Nord med Tidskr*, January 16, 1937, p 85) reports from his hospital in Altona the results he has achieved in the early diagnosis of cancer of the cervix by the employment of Leitz or Zeiss instruments in the survey *in situ* of the surface of the cervix It is brought to view as for an ordinary macroscopic examination through a speculum, but the enlargement by ten times of the structures seen enables the examiner to familiarize himself with a great variety of conditions, normal and pathological, hitherto unrecognized by naked-eye examination or by palpation with one finger After a little practice it becomes possible to distinguish correctly between physiological and pathological pictures, and to discard the common clinical diagnosis of an erosion unless there is actually loss of epithelium at a given point The author has already in 190 cases succeeded in detecting cancer in an early stage by the system he describes, and he has found that in about one-third of all the suspicious cases in which the cervix and surrounding structures were examined *in situ* and through the instruments used, a subsequent microscopical examination of excised tissues revealed malignant disease In addition to revealing malignant disease before it has given rise to any clinical symptoms, this system facilitates the diagnosis in more advanced stages, small ulcers and tumours being seen much more clearly than on a naked-eye examination The author has often observed cases of malignant disease which had been overlooked by experienced gynaecologists, and the true nature of which became evident on examination by one of his assistants This new system does not render exploratory excisions and subsequent microscopical examinations superfluous, but it greatly facilitates the discovery of suspect areas requiring excision and microscopical examination The exploratory excision is thus rendered an even more delicate test than it was before

Pathology

206 Cultivation of Typhus Virus

F BREINL and E CHROBOK (*Zbl Bakt*, 1937, **138**, 129) record the successful cultivation of the viruses of typhus and of Rocky Mountain spotted fever in a simple tissue serum medium Small pieces of tunica vaginalis from a guinea-pig are inoculated with a suspension of brain or spleen from an infected guinea-pig in the febrile stage, and are added to dilute guinea-pig serum (one part serum and two parts tyrode solution) contained in a small Erlenmeyer flask After seven days' incubation at 37° C a small piece of tunica is taken from the culture and ground up in a mortar Part of the suspension is used to inoculate a fresh batch of serum, part is used for microscopical examination, virulence experiments, and bacterial sterility tests In such a medium the typhus virus becomes microscopically demonstrable after two to five subcultures Rickettsial bodies are found in large numbers in the endothelial cells of the tunica, and animal tests show them to be highly virulent The virus of Rocky Mountain spotted fever takes rather longer to develop, and is not microscopically demonstrable until after five to eight passages Neither tissue nor serum can be dispensed with in the medium Whether living cells are required seems doubtful, since growth apparently occurs even when N/100 sodium cyanide is added to the culture Growth likewise takes place in the presence of immune serum, though some agglutination of the rickettsial bodies is demonstrable

207 Diagnosis of Rabies

L T WEBSTER (*Amer J publ Hlth* 1936, **26**, 1207) describes a method that appears to be of some value in the diagnosis of rabies Sterile pieces of Ammon's horn taken from the suspected case are made into a 5 to 10 per cent suspension in distilled water, and injected in a dose of 0·03 c cm intracerebrally and 0·25 c cm intramuscularly into each of six of a specially susceptible breed of mice Three animals are sacrificed on the fifth, sixth and seventh days respectively and the brains examined for Negri bodies The remaining three mice are observed for four weeks for signs of rabies, when prostrate they are killed and their brains examined as before Using this method the author has been able to demonstrate rabies infection not only in dogs, but also in three out of nine supposedly normal skunks The mouse inoculation method, moreover holds out promise for assessing the value of various antirabic vaccines By taking sera from human beings and mice that had been vaccinated in different ways, mixing it with progressive dilutions of mouse passage virus, incubating at 37° C and injecting the mixture intracerebrally into mice, it was found possible to titrate the neutralizing antibody of the sera Preliminary results indicate that commercial vaccines differ greatly in their potency, that vaccines containing no demonstrable living virus may yet immunize satisfactorily, and that in mice the highest degree of immunity seems to be reached by six doses of vaccine given intraperitoneally on alternate days

208 Bacillus Suipestifer

R VEDEL (*Thèse Paris*, 1936, No 734) states that the European *B suipestifer*, the American *B suipestifer*, and the bacilli of Eastern Europe of the Hirschfeld type are closely related to one another but are not identical The Hirschfeld bacillus ferments dulcite and arabinose, and in cultures its specific colonies can always be identified The American *B suipestifer* does not ferment either dulcite or arabinose, nor does it produce sulphuretted hydrogen in media containing lead acetate Specific colonies can always be isolated from its cultures The European *B suipestifer* does not ferment arabinose but does ferment dulcite at a late stage, and never shows specific colonies in its cultures In only very rare cases has the American *B suipestifer* been found in man, whereas the European *B suipestifer* has been found in cases of food poisoning, diseases resembling paratyphoid septicaemia, and miscellaneous diseases such as arthritis, enteritis, and abscesses Cases of this kind have occurred in Europe, especially England, and in America The two possible sources of infection are the faeces of pigs and the meat of these animals when affected with swine plague and even non-specific infections The laboratories in which pork is prepared for consumption should therefore be kept at a distance from slaughterhouses, and as far as possible the slaughtering on the one hand and the preparation of food on the other should be carried out by different sets of workers

209 Ultra-violet Irradiation

S KITAMURA and M MURAYAMA (*Klin Wschr*, January 16, 1937, p 88), using the Schultz-Dale method, were unable to confirm Murayama's previous findings that horse serum irradiated for thirty minutes with ultra violet rays is capable of preventing anaphylactic shock Pure horse serum and serum diluted 1 in 10 with sodium chloride solution were used, 1 c cm of horse serum was injected intraperitoneally into sixteen virgin guinea pigs Three weeks later, after preparation of both uterine horns, the Schultz-Dale test was applied Horse serum irradiated by a Kromayer lamp for thirty minutes was used The authors' findings were as follows (1) A new substance is formed in the irradiated serum which produces a contraction of the normal uterus (2) Contraction of the uterus after the addition of non-irradiated serum was conceived as an antigen-antibody reaction Addition of diluted irradiated serum brought about complete desensitization (3) Irradiated serum always produced contractions of the uterus whether this was sensitized or desensitized The authors believe that it is on account of the new substance produced in horse serum after irradiation that its capability of preventing anaphylactic shock cannot be proved by the Schultz-Dale reaction

Dr Adrian was awarded the Nobel Prize for Medicine in 1932 and has been Gedge Prizeman Raymond Horton Smith Prizeman, and Foulerton Research Professor of the Royal Society

W H G Jessop and J W S H Lindahl have been examined and approved for the degree of M Chir

During the month of February the title of the degree of M D was conferred by diploma on Mrs A M Stewart (Girton) that of M B on M Ball (Newnham) and that of B Chir on M E Barnard (Newnham)

UNIVERSITY OF LONDON

Recognition of Teachers

The following have been recognized as teachers of the University in the subjects indicated in parentheses

Guy's Hospital Medical School Mr C Lambrinudi (Orthopaedics)

St Thomas's Hospital Medical School Dr T Anwyl Davies (Venereal Diseases) Mr N R Barrett and Mr B W Williams (Surgery) Mr R K Bowes Dr A J Wrigley and Mr J M Wyatt (Obstetrics and Gynaecology) Mr W Rowley Bristow and Mr George Perkins (Orthopaedics) Dr G B Dowling (Dermatology) Mr Philip G Doyne and Dr G G Penman (Ophthalmology) Dr J St C Elkington Dr H Gardiner Hill Dr Reginald Hilton and Dr J Forest Smith (Medicine) Mr Geoffrey Fildes (Radiology) Mr W A Mill and Mr D F A Neilson (Oto rhino laryngology) Mr H B Wilson (Anaesthetics)

The Senate on February 17 resolved that the *Addendum to the British Pharmacopoeia* published in 1936 be used at the second examination for medical degrees in and after July 1938

Mr H J Nightingale has been appointed governor of the University College of Southampton

University Medals

The University Medals in Pathology and in Psychological Medicine at the M D examination for internal and external students in December 1936 have been awarded to A H T Robb Smith (St Bartholomew's Hospital) and to A C Dalzell (King's College Hospital) respectively The University Medal in Surgery at the M S examination for internal and external students in December 1936 has been awarded to J B G Muir (Middlesex Hospital)

UNIVERSITY COLLEGE

A public lecture on Blood Groups and Genetics will be given by Dr V Friedenreich of Copenhagen in the Galton Laboratory University College Gower Street W C on Wednesday March 17 at 5 30 p m with Professor R A Fisher F R S in the chair The lecture is open to the public without fee or ticket

MIDDLESEX HOSPITAL MEDICAL SCHOOL

The University of London invites applications for the S A Courtauld Chair of Anatomy tenable at Middlesex Hospital Medical School The salary will be not less than £1 000 a year and applications for the post must reach the Academic Registrar, University of London W C 1 by April 23

The Services

HONORARY PHYSICIAN TO THE KING

Major General G A D Harvey C M G has been appointed Honorary Physician to the King in succession to Major General T S Coates C B O B E, who has retired

DEATHS IN THE SERVICES

Colonel HARRY ARTHUR LEONARD HOWELL C M G R A M C (ret) died at Lincoln on February 26 aged 69 He was born at Old Brompton Kent on December 19 1867 the son of Major R Howell and was educated at Manchester Grammar School and Queen's College Cork Entering the Army as surgeon lieutenant on January 29 1895 after a period of general practice he became lieutenant colonel on March 1 1915 and retired on account of ill health with the rank of colonel on October 31 1921 He served with No 1 General Hospital Tirah Expedition 1897-8 and was on plague duty during the Bombay plague 1900 He was Parkes Memorial Gold Medallist in 1901 and was a writer on military medical history During the great war he served in France and Italy, being mentioned in dispatches and awarded the C M G

Lieut Colonel ARTHUR DE COURCY SCANLAN R A M C (retired) died at Hailsham Sussex on February 21 aged 76 He was born at Bristol on December 9 1860 and was educated at Westminster Hospital where he gained a prize in clinical medicine in 1881 He took the L S A in 1882 the M R C S in the following year and the L R C P in 1898 After filling the posts of house surgeon at Westminster Hospital and at the Royal Westminster Ophthalmic Hospital and of clinical assistant at the West End Hospital for Nervous Diseases he entered the Army as surgeon on January 31 1885 in which year he gained the Parkes memorial medal for hygiene at Netley He was on temporary half pay on account of ill health from March 11 1896 to January 4 1897 but attained the rank of lieutenant colonel after twenty years service retiring on September 6 1905 While on the retired list he was employed at Dorchester in 1905-6 at Woking in 1906-8 and at Guildford in 1909 and for some years after He had been a member of the British Medical Association for forty four years

Medical Notes in Parliament

The Public Health (Drainage of Trade Premises) Bill was read a first time in the House of Lords on March 3 on he motion of Lord Gage On the same day the Lords read the National Health Insurance Act (Amendment) Bill a third time On the second reading of the same Bill, which was taken on February 25 Lord Gage explained that it was made necessary through changes of nomenclature introduced by the Pharmacy and Poisons Act 1933 The Bill would substitute in the National Health Insurance Act 1936 words with the object of regularizing contracts made with corporate bodies by the Insurance Committee of each county or county borough for the supply of medicines to insured persons It would also make clear that such contracts could be entered into in future on the same basis as before the Act of 1936 Lord Gage mentioned the proviso that dispensing must be by or under the direct supervision of qualified pharmacists

The Divorce (Scotland) Bill was reported to the House of Lords from committee without amendment on March 4 On March 9 the Children and Young Persons (Scotland) Bill and the Merchant Shipping Bill were read a second time

The House of Commons this week discussed the financial resolution governing the proposed further assistance to the Special Areas Orders incidental to the establishment of the new systems of government in India and Burma were approved The Annual Holiday Bill was reported to the House from a Standing Committee on March 3 and on March 4 the Defence Loans Bill was read a third time The Methylated Spirits (Scotland) Bill was read a second time without debate on March 9 On the same day the report of the Royal Commission on Local Government in the Tyneside Area was presented to Parliament

Factories Bill in Committee

A Standing Committee of the House of Commons on March 2 resumed consideration of the Factories Bill at Clause 2 which deals with overcrowding Mr ELLIS SMITH moved that the provision exempting existing workrooms from the new regulation regarding cubic space per worker should not apply at times when persons were being employed overtime He said that a subsequent amendment to be moved by the Home Secretary would propose that Home Office inspectors should require the provision of effective and suitable mechanical ventilation He gathered that until an inspector paid a visit a firm might be able to carry on for months and years under the old standards Even under these

Decline and Fall of the Undescended Testis

Lancet p 999 May 2 1936 A Report on 25 treated cases

GROUP	TYPE	CASES	RESULT
I Adherent Normal Testis Normal Child	Unilateral - -	5	Failed

standards 16,649 firms had been served last year with contravention notices Under the Home Secretary s amendment it would be possible for young persons between 16 and 18 to work in a room of 250 cubic feet per person for fifty-four hours a week, and it would be possible for girls of 16 to be occupied in such a room for ten and a half hours a day The deleterious effect would be greater if employees were asked to work above the normal hours in factories under such unhealthy conditions

Sir JOHN SIMON said that he and his advisers were not satisfied with the form of the proviso exempting from the general obligation to provide cubic space for workers He did not like the fact that it made possible an indefinite prolongation of the less satisfactory standard, nor did he wish the Bill to leave the committee in a form whereby certain workshops because they were to be built hereafter, would be on the 400 cubic feet principle, while others, because they already existed, might without any limit of time remain on the lower standard He would have to confer with representative authorities, and would ask the committee to insert an amendment in the names of Mr Lloyd and himself on the understanding that during the report stage they would have a plan whereby the 250 cubic feet standard would disappear within a limited number of years As for the provision proposed by Mr Ellis Smith he saw a great difficulty in putting it in His advisers told him it was not practical to reduce the number of people who worked overtime, for the result would be that those left would work more overtime Mr RHYS DAVIES said that the Opposition did not see the difficulty which Sir John Simon apprehended about the number of people employed in a room Sir ERNEST GRAHAM-LITTLE said that all scientific research demonstrated that movement of air was more important than cubic space and if the committee laid stress on cubic space it missed the most essential thing On battleships the sleeping accommodation provided for sailors was 50 cubic feet That was made possible by effective ventilation Bacteriological infection spread far more quickly in still air than in moving air, and still air induced fatigue

Mr ELLIS SMITH then withdrew his amendment On the motion of Sir John Simon the committee added words to ensure that the premises in which the lower standard of cubic space was permitted should only be those which had, since the passing of the Bill, been continuously in the same occupation

Sir JOHN SIMON then secured the adoption of an additional proviso laying down that

'(*a*) If the inspector for the district requires the provision of effective and suitable mechanical ventilation in any such room and the requirement is not complied with this proviso shall cease to apply to that room notwithstanding that the said period of five years has not expired and (*b*) if at the expiration of the said period effective and suitable mechanical ventilation is provided in any such room (whether in pursuance of the inspector s requirement or otherwise) this proviso shall continue to apply to that room so long as such ventilation is provided and maintained '

After a discussion on the provision authorizing the inspector for the district to require the posting in a workroom of a notice specifying the number of persons who might be employed there the clause, as amended, was approved and the committee adjourned

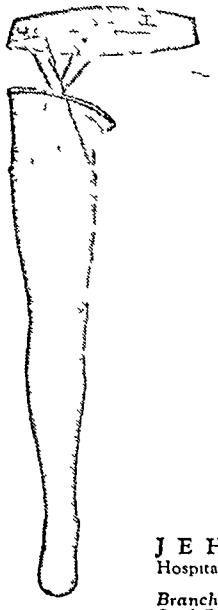
TEMPERATURE OF WORKROOMS

The committee resumed on March 4, when Clause 3 (temperature) was considered The clause provided that no method of ventilation should be employed 'which resulted in the escape into the air of any fume of such a character and to such an extent as to be likely to be either injurious or offensive to persons employed therein ' Mr GRAHAM WHITE moved to insert words forbidding the escape of any fume likely to affect the purity of the air He said it was difficult to find words dealing with fumes and gases in the air upon which practical administration could be based Gases escaping from heating apparatus and so on might be highly dangerous without being in the least offensive Mr GEOFFREY LLOYD said the provision in the existing law was to the effect that there must be no interference with the purity of the air in the room and that provision had been deliberately altered It had probably been put into the 1901 Act from the old fashioned idea that the amount of carbon dioxide in the room was the measure of the effective purity of the air from the point of view of the individual Research had proved that to be quite wrong The fundamental question was not the purity of the air but whether there was anything in the air which was injurious or offensive The amendment would make it an offence for there to be some mild impurity of a chemical kind only to be detected by chemical instruments and not in the least injurious or offensive

Mr GRAHAM WHITE said it would be possible to have an injurious percentage of carbon monoxide in the air without it being offensive He agreed it was difficult to reach a form of words which would satisfy everybody, and he withdrew the amendment

Mr MANDER also withdrew an amendment which sought to remove the restriction to persons who worked seated, in the subsection which provided that a temperature of not less than 60° should be deemed reasonable after the first hour where the work did not involve serious physical effort Mr RHYS DAVIES moved to leave out the limitation which restricted the minimum of 60° to time worked after the first hour He said that this restriction was not in the Factories Bill which had been introduced in 1924 Sir JOHN SIMON said the whole subsection was an experiment There was no power under the present Act to prescribe standards of temperature by degrees Fahrenheit, and precise limits of temperature would be difficult to lay down at the beginning in some cases Even in the same industry opinion differed among workpeople on what constituted a suitable temperature If Parliament insisted that at the moment of opening the factory the temperature must be not less than 60° it was likely to expose people to unreasonably high temperature before work was finished Mr Rhys Davies withdrew his amendment

Mr MANDER moved to provide that the temperature after the first hour should be recorded in each workroom by "other instruments for recording temperature prescribed by the Secretary of State" as an alternative to the provision of at least one thermometer as laid down by the Bill Sir JOHN SIMON said that the thermometer meant an instrument for measuring temperature and the proposed alternative words were unnecessarily elaborate Mr Mander then withdrew his amendment and the chairman ruled that this cut out an amendment tabled by Sir Ernest Graham-Little to ensure provision beside the thermometer of "one katathermometer or other similar instrument for testing ventilation and coolness of air"



The clause was then accepted and added to the Bill without amendment

VENTILATION

On Clause 4 (ventilation) the committee, on the motion of Sir John Simon, amended the wording to lay down that the provision of the circulation of fresh air in each workroom should be suitable as well as effective Other amendments were negatived after brief discussion

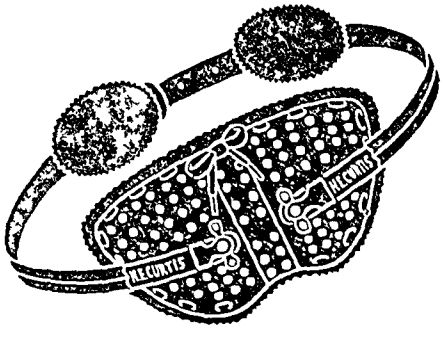
Mr SILVERMAN moved to add at the end of the clause 'provided that no mechanical ventilation shall be deemed efficient which does not secure such frequency of complete changes of air in the workroom as the Secretary of State may by order direct' He said there was unanimity among experts that the effectiveness of mechanical ventilation depended in the main on the frequency with which the air in the workroom was completely changed In aeroplane factories poisonous fumes had been removed by mechanical ventilation which completely changed the air in a room thirty times an hour Sir JOHN SIMON said the clause already provided that the Home Secretary might by regulations prescribe a standard of adequate ventilation for factories or for any class or description of factory or parts thereof Sir ERNEST GRAHAM-LITTLE said sufficient attention had not been given to the importance of change of air in a room To insist on so many changes an hour was not practicable A far better system could be adopted A simple instrument in the form

"Solvitur Ambulando"

The great advances in recent years in prostheses for the lower extremities are exhaustively described and extensively illustrated in a 72-page book under the above title

Copies gratis to the Medical Profession on application

This book fully describes the latest developments in mechanical technique in relation to light metal and wood artificial limbs, with descriptions and illustrations of every type of modern prosthesis for amputations and congenital deformities of the lower extremities It is the result of practical experience gained in rehabilitating over 100,000 amputees by the Hanger establishment, which is many times larger than any other limb makers in the world



This great British organisation is solely devoted to making and fitting artificial limbs It provides a Nation wide service, and in every part of the British Isles and the Irish Free State, the Medical Profession, Hospitals and amputees have at their command the best that modern science and skill can offer

CURTIS ABDOMINAL SUPPORT No 1

Gives Scientific support without Constriction

The anterior posterior pressure of the Curtis Abdominal Support No 1 is recognised as the most satisfactory method of giving support to the lower abdomen without employing undue circumferential pressure The support is light in weight and scientifically designed to give greater freedom to the hips than any other It is unhesitatingly prescribed by medical men as the most efficient support for all forms of Abdominal Ptosis

of a thermometer could be used to test the efficiency of the ventilation and the temperature of the air

Mr SILVERMAN withdrew his amendment and Clause 4, as amended, was added to the Bill

LIGHTING

On Clause 5 (lighting) Mr CARTLAND moved to add the words after the provision that the Home Secretary could, by regulations prescribe a standard of sufficient and suitable lighting enabling the Home Secretary by special regulations to direct that any operation in a factory should be carried on while sufficient natural lighting was available during the day time Mr HAMILTON KERR said the Institute of Industrial Psychology had proved the bad effect of poor lighting on the health and productive capacity of workers in factories When a worker suffered from headache or eye strain or had to look too closely at his work he suffered ill effects and his production fell off The same was true where he had to work with different colours or with various tools which he had to change from time to time

Sir JOHN SIMON said the committee must consider whether it would be practicable to carry out the amendment We lived in a country where there was sufficient daylight one day and not sufficient another and when the day was dull it might be greatly to the advantage of workpeople to turn on the artificial light In Clause 5 as it stood the Bill was taking a great step forward There was not any provision in the factory law at this moment requiring adequate lighting except in certain dangerous trades That was scandalous In making a big reform the committee ought not to place on the Home Secretary the duty of making regulations which it would not be easy to enforce Mr BUCHANAN asked whether the Home Secretary could not do something to deal with the case of a factory in which one side was light and the other had a windowless wall and some of the employees were against this wall Provision should be made to deal with cases where there could be ample accommodation in natural daylight if only the employer cared to use it properly Sir JOHN SIMON said he would look into the matter His impression was that a little pressure from the factory inspector would meet such a case

Mr CARTLAND withdrew his amendment

On Subsection (3) of Clause 5 which laid down that nothing in the earlier provisions should be construed as enabling directions to be prescribed or given as to whether artificial lighting is to be produced by electricity gas or any other particular means Mr RIDLEY moved to leave out the whole subsection Sir JOHN SIMON said that the Home Secretary under the Bill would be able to require a standard candle power of sufficient and suitable lighting in every part of the factory but it was no part of the business of the Home Office to say how that lighting was to be produced

Mr BROAD said that for most industrial processes where fine work and steadiness of hand were required gas lighting was obsolete Parliament was contemplating the possibility of having to defend the public against gas attack and workers in factories might have to work in gas tight rooms The only possible illuminant in such conditions was electricity Mr BUCHANAN said the use of naked gas lights in joiners' or carpenters shops was dangerous

Sir JOHN SIMON said that other parts of the Bill dealt with safety He suggested to the committee that it should omit from the Bill the references both to gas and electricity and merely to forbid the giving of instructions as to whether any artificial lighting is to be produced from any particular source of illumination It could still insist that there should not be a glare of lighting throughout the shop The committee accepted the amendment

A discussion then followed on the subsection providing that all glazed windows and skylights of workrooms should be so far as practicable kept clean on both the inner and outer surfaces The committee made some small amendments and the clause as amended was added to the Bill

The committee then adjourned until March 9

Respirators and Concentrated Gases

Mr PARKER on March 2 asked the Home Secretary what was the rate of rise of pressure across the filter when smokes were present in the area in a concentration of 0 6 gramme per cubic metre and were breathed through a civilian respirator

Mr GEOFFREY LLOYD said that the concentration of arsenical gas mentioned in the question was extremely high and such as could only be produced in quite exceptional circumstances It was considered that such concentrations were unlikely to be encountered by the general civilian population under ordinary practical conditions and the question as to the behaviour of the civilian respirator under these hypothetical conditions had therefore no practical significance

Mr PARKER also asked the Home Secretary for what period of time the civilian respirator was calculated to give complete protection respectively when phosgene was present in the air in a concentration of 10 grammes per cubic metre and when mustard gas vapour was being given from the ground when the atmospheric temperature was 15 C and there was no wind

Mr LLOYD replied that the concentration of phosgene mentioned was extremely high Such a concentration would be very difficult to maintain under ordinary practical conditions It would therefore be misleading to give the period for which the civilian respirator afforded protection against such concentration The Government was satisfied that this respirator would afford protection against such concentrations as were likely to be encountered by the general civilian population under normal conditions The civilian respirator would protect the wearer for very long periods against mustard gas vapour under the conditions mentioned

Cleanliness of Hairdressers' Premises

A Private Bill Committee of the House of Commons on March 8 considered the Southampton Corporation Bill which seeks powers in one of its clauses to establish a compulsory register of hairdressers and barbers premises and to make by laws for securing the cleanliness of the premises

Dr H C MAURICE WILLIAMS medical officer of health for Southampton said he had inspected a number of hairdressers and barbers shops in the town Generally speaking the inspection revealed that there were a large number of hairdressers premises without water supplied to the saloon In some cases the basins were emptied or drained into buckets and he had seen premises where hot water was either brought in in a kettle from the living quarters at the rear or boiled on a fire in the saloon In a number of cases no paper was laid on the head rests of the chairs and the use of antiseptic solution particularly in respect of shaving brushes was apparently unknown His inspection of these smaller hairdressers shops justified his committee in inserting the clause in the Bill Unless proper precautions were taken with regard to cleanliness and sterilizing there was great danger of spreading disease Ringworm was undoubtedly spread in a number of cases by barbers shops Another disease impetigo which was common to children could also be spread They had about seven hundred cases in a year usually among children but sometimes among adults In Southampton where there were a number of Lascars and foreign crews it was possible that a tropical disease similar to ringworm but very much more difficult to cure and seldom found in this country would be spread There was also the question of vermin In cross examination Dr Williams said that the Bill was mainly aimed at a very small number of poor barbers shops in the poor part of the town but even in the better class hairdressers there was room for improvement

Mr ASKEW on behalf of the Hairdressers Association opposing the Bill said it was not right that the corporation should be given these overriding powers for a large and important trade in the whole of Southampton because there were in one part near the docks one or two shops of the condition described No system of control or by laws could prevent a barber having dirty hands If it was thought proper that there should be some registration or supervision of the activities of hairdressers that was a matter for general legislation Last

RHEUMATIC cases find soothing comfort in 'Viyella' Sheets. *Letters of appreciation also from chronic invalids and the aged*

Those who have recently made the acquaintance of 'Viyella' Sheets are warm in their praise From many parts of the country come letters telling of the comfort Viyella Sheets have brought to sufferers from rheumatic complaints to chronic invalids, the aged, and others who dread the chill of linen or cotton sheets Many members of the Medical Profession have shown their confidence in 'Viyella' Sheets by recommending them to their patients, and have even gone so far as to write personal letters endorsing the claims that have been made Now, when the resistance of those who suffer from chronic illness is lower, the kindly comfort and sweet relief of 'Viyella' Sheets will be doubly welcome

NATURAL WARMTH AND SOOTHING COMFORT

Viyella Sheets have the smooth touch of linen but the warm feel of wool They are porous and light as down absorb perspiration, and are absolutely non irritant They bring the *natural* warmth and soothing comfort which induces sleep No amount of washing, year in, year out, will spoil their freshness

If you have not already received detailed particulars of Viyella Sheets we shall be pleased to send these together with samples of the fabric Inquiries should be addressed to William Hollins & Co Ltd (Medical Inquiries) Viyella House Nottingham

* EXTRACT FROM THE 'PRACTITIONER' *

Most practitioners have patients—sufferers from rheumatism, neuritis sciatica, nephritis, pneumonia etc —whom they know would be much better off sleeping between blankets, but the patients frequently dislike the irritation and the weight of the blankets In view of this, we have been asked to make a test of Viyella Sheets, as being the happy medium between the heavy blanket and the cold sheet There was no suggestion of weight or irritation and there was an unusual cosiness in getting into bed between Viyella' Sheets The feeling of soothing and comfort which ensued ought to do good to invalids and convalescents

'VARIBAN' ELASTIC PLASTER BANDAGE

VARIBAN BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg It is made from a specially woven selvedge material possessing highly elastic properties and is impregnated with an antiseptic zinc oxide paste

'VARIBAN is self adhesive and combines the principles of firm equable pressure and support to the swollen leg with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair

In promoting proper circulation VARIBAN steadily reduces oedema It provides protection to the granulations of the healing ulcer In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application The necessity for ointments lotions etc is obviated while VARIBAN provides an ambulatory treatment which allows of full activity of the limbs with better results than those following rest in bed alone

year the Hairdressers' Registration Bill was introduced into Parliament, but it was too late in the session for it to proceed The Bill would very shortly be reintroduced, and it made provision for the proper supervision and control of these premises

The committee decided that there was justification locally for the clause and that, so far as the clause was concerned, the preamble of the Bill was proved

Health Services in Special Areas—In a tabulated statement which he furnished to Mr Batey on March 4 Mr ERNEST BROWN showed that the Commissioner for Special Areas in England and Wales had entered, up to January 31, 1937, into commitments of £1,519,360 for hospitals, £39,610 for maternity and child welfare services, and £53,250 for district nursing and ambulance services Expenditure by the Commissioner on the same services in that period had been respectively £23,220, £8,560, and £31,400

Vitamins Added to Margarine—Mr WILLIAM LEACH, on March 4 asked if the Minister of Health was aware that it was the practice of manufacturers of margarine to add cod-liver oil or other oil from fish livers and to treat with ultra-violet rays or by other means artificially to vitaminize the margarine synthetically under the claim that its food value was then equal or superior to that of summer butter Sir KINGSLEY WOOD replied that vitamins were added artificially to some brands of margarine He had no reason to doubt it was possible to make margarine the equivalent of butter in vitamin content No investigation had been made by experts of his department to decide whether the claims mentioned by Mr Leach were valid

Manchester Royal Infirmary and New Labour Exchange—On March 8 Mr ECKERSLEY asked the Parliamentary Secretary to the Ministry of Health, as representing the First Commissioner of Works, whether, before the plans for the new labour exchange in Manchester were approved, full consideration would be given to the value to the city of the Robey Street branch of the Manchester Royal Infirmary and to the necessity for ensuring that the new exchange would not interfere with its light or amenities Lieut Colonel MUIRHEAD said he was aware of the position regarding the erection of the new central employment exchange for Manchester The Minister of Labour and the First Commissioner for Works had discussed the matter with the chairman and other members of the board of the Royal Infirmary After careful consideration the Minister had decided that the building of the exchange should proceed and the contractors were now working on the site

Typhoid Fever Outbreak at Liverpool—On March 8 Mr GROVES asked the Minister of Health whether any investigation had been made into the milk consumed by the sufferers in the recent outbreak of typhoid at Liverpool, and whether the majority obtained their milk from the same source or from different sources Sir KINGSLEY WOOD replied that this outbreak had been investigated by officers of the Liverpool City Council Some 60 per cent of the persons affected obtained their milk supply from the same retailer, but there was no reason to think that milk was the source of infection in these cases

Notes in Brief

On March 2 Mr RUNCIMAN replying to Mr T Williams, said he understood that the rise in the price of glycerin in recent months was due to an expansion of normal industrial demand and that the effect of the Government's rearmament programme on the position could be regarded as negligible

The number of textile factories in the West Riding in which women and young persons over 16 are employed on a two-shift system is nineteen and the number of women and young persons so employed is rather over 1 000

About 90 000 workpeople in England and Wales are covered by agreements providing for holidays with pay

A Bill to extend the principle of removal of the blind from the administration of the Poor Law is in preparation

The taking of certain protective measures at the Palace of Westminster against gas and other air attack risks is under consideration

Medical News

The House of the British Medical Association, including the Library, will be closed for the Easter holiday from 6 p m on Thursday, March 25, until 9 a m on Tuesday, March 30 (Library 10 a m)

Owing to the illness of Professor Georges Portmann the meeting of the Chelsea Clinical Society, arranged for March 16, has been cancelled

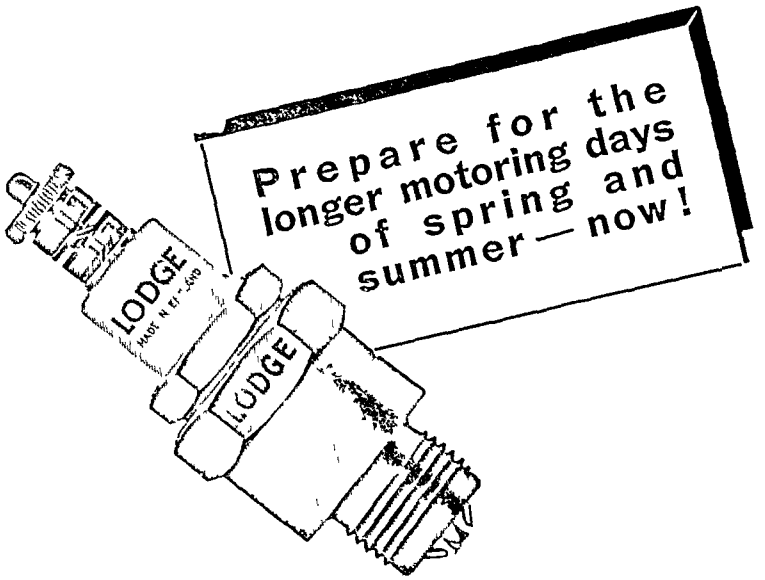
The following members of the medical profession were returned at the London County Council's elections on March 4 Dr J A Gillison (Lab), Bermondsey, Rotherhithe, Dr Esther Rickards (Lab) Greenwich, Dr B Homa (Lab), Hackney, Central, Dr S Monckton Copeman (M R), Hampstead, Dr S W Jeger (Lab), Shoreditch, Dr C W Brook (Lab), Southwark North, Mr Somerville Hastings (Lab), Stepney, Mile End, Dr Florence B Lambert (M R), Westminster, St Georges

Dr A G Mutland-Jones and Dr L Mandel will open a discussion on "Gastro enteritis in Children" at a meeting of the Hunterian Society at Simpson's Restaurant, Cheapside, E C, on Monday, March 15, at 8 30 p m The meeting will be preceded by a dinner at 7 15 p m

The annual dinner of the Medical Superintendents' Society will be held at the Langham Hotel, London, W, on Saturday, March 20, at 7 30 p m

A meeting of the Sussex Association of the Medical Women's Federation will be held at the new Sussex Hospital, Brighton, on Thursday, March 18, at 5 30 p m, when Dr Janet Vaughan will read a paper on "The Diagnosis and Treatment of Common Anaemias" Members of the Brighton Division of the British Medical Association are invited to be present and to take part in the subsequent discussion

The German Society of Balneology and Climatology will hold its spring meeting at Breslau from March 26 to 28



The fourth International Congress on Leprosy will be held in Cairo on March 21 The first was held in Berlin in 1897, the second in Bergen in 1909, and the third in Strasburg in 1923

The sixty first Congress of the German Society for Surgery will be held in Berlin from March 31 to April 3, when papers will be read by K H Bauer of Breslau on the progress of experimental research on tumours, the nature and treatment of pseudarthrosis, by G Magnus of Munich, the surgical importance of vitamins, by A Fromme of Dresden and the physiological principles of circulatory collapse, by H Rein of Gottingen

The January issue of the *Archives of Dermatology and Syphilology* is dedicated to Dr William Allen Pusey on the occasion of his retirement from the editorship

We are asked to state that at the Kaiserin Friedrich Haus, connected with the Berlin Academy for Post Graduate Medical Study, there is a bureau of general information which will, gratuitously and with strict impartiality, answer all questions pertaining to matters of interest to physicians Every foreign practitioner visiting Berlin is urged to get in touch with this information bureau (Auskunftei), Berlin N W 7, Robert Koch-Platz 7 either by writing or by personal call, so that a plan for the most profitable utilization of the time at his disposal may be drawn up for him The bureau is also willing to provide letters of introduction to clinics, institutes, etc, in Berlin as well as in other parts of Germany

During the week ended March 6 the number of deaths ascribed to influenza in the 122 great towns (including London) of England and Wales was 181 compared with 242 in the preceding week In London the number of deaths from influenza was sixteen, compared with twenty three in the preceding week The notifications of pneumonia in London were eighty five against 101

The issue of the *Bulletin de l'Office Internationale d'Hygiene Publique* for January contains a report by Professor D Danielopolu the delegate of Rumania and Drs C Dimitru and Tanasoca on the problem of rheumatism and diseases of the circulation A supplement is devoted to papers on the education of backward or abnormal children

Sir Arthur MacNalty Chief Medical Officer of the Ministry of Health referred to the possibility of reducing mortality and sickness among young children at the toddler stage ' in an address delivered at the opening of a new maternity and child welfare centre at Hornsey on March 1 The decline in the rate of infant mortality for England and Wales as a whole had he said, been a source of satisfaction to all concerned with infant welfare The success achieved in the reduction of infant mortality gave ground for hope that in due course a corresponding advance might be made in protecting children in the next important stage of life—the toddler " stage—from those impairments which could be avoided or mitigated by careful supervision Here continuity of medical supervision, before and after school age was reached was of much importance, and called for a maximum degree of co ordination between the maternity and child welfare service and the school medical service

The Bishop of Birmingham, preaching before the University of Oxford on March 7 said The cost of social derelicts and especially of the feeble minded is harmful in that indirectly it presses on all classes I cannot think it right to keep alive individuals whom doctors know to be doomed from birth to a subhuman existence A false humanitarianism is at the present time a drag on social progress ' Dr Barnes also said It is well to emphasize that the lower middle and artisan classes are the most valuable population reservoir of the country They replenish the wealthier classes which constantly tend to disappear, and from them come at an interval of a generation or two, many of the nation s leaders '

In memory of Nicol McNicol Rankin *M C* M B, who died in December, 1931 a fund has been opened to commemorate his name in the Central London Throat, Nose and Ear Hospital with which he was closely associated as a surgeon and a member of the committee of management Mr Rankin s interest in and affection for the hospital was very great and notwithstanding the lapse of time his work has not been forgotten in the institution he loved so well A number of friends have therefore inaugurated a fund to provide a permanent memorial and it is felt that the naming of a cot in the children s ward would be the most appropriate way Gifts for The Nicol Rankin Memorial Fund ' may be sent to the treasurer Lord Erskine of Restormel Central London Throat, Nose and Ear Hospital Gray s Inn Road W C 1

Dr T Madsen, chief of the State Serum Institute in Copenhagen has again been elected a member of the Health Committee of the League of Nations and has become for the seventh time its president

A recent epidemic of approximately 500 cases of scarlet fever in Oswego Tioga County, New York State has been traced to the use of raw milk from a cow which had been infected on a farm where there had been three cases of scarlet fever

It is reported that 142 cases of cerebro spinal fever have recently occurred in Cyprus including eighteen in the capital Nicosia, with a mortality of 30 per cent

Dr Julius Wagner Jauregg professor of psychiatry and neurology at Vienna, celebrated his *eightieth birthday on* March 7, and Geh Rat Dr Emil Abderhalden professor of physiology and president of the German Academy of Natural Sciences at Halle celebrated his sixtieth birthday on March 9

Sterilization has been made legal in the canton of Vaud in Switzerland

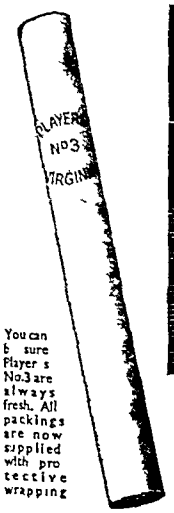
QUERIES AND ANSWERS

Oxaluria



PERPLEXED writes Perhaps some of your readers may be able to suggest a satisfactory method of prophylactic treatment for a woman patient of mine Urinary calculi form every few months causing considerable agony until voided On analysis they consist of calcium oxalate and fibrin Dieting with the exclusion of meat egg yolk and certain vegetables *has failed as have Vichy and Contrexéville* waters to prevent the *formation of the calculi*

External Use of Iodine

Dr J C MACAULAY (Northampton) writes in reply to E P (*Journal* February 27 p 482) The antiseptics I have in mind as satisfactory are derived from xylenol There are several preparations by good firms now on the market I did not mean to convey by my first letter (February 13 p 374) that iodine was of no use but that it had certain disadvantages

Dr W R GROVE (St Ives) writes Instead of this unsatisfactory application for some twenty years I have used a mixture of lysol 2 drachms with ether 1/2 oz in surgical spirit to 4 oz The wound is cleaned with the solution and is then dressed with gauze wrung out in it The smarting lasts only about a minute and is probably not more than with the iodine Afterwards it is a comfortable dressing and where the application has reached the depth of the wound there is no pus formation Bleeding is stimulated but the solid mass formed with the blood can be usually left till healing has occurred In roadside accidents one s own hands can be disinfected with the same solution Lately I have substituted dettol for lysol in the same quantity and find it just as satisfactory The same solution is used for disinfecting instruments and syringes but in the latter case the syringe is washed out before use with pure spirit or sterile water As an unashamed Victorian trained under the carbolic spray I have never deserted antiseptic for aseptic midwifery and I use this solution to disinfect the external parts several times during labour and the inside of a rupture before suture while my own hands and arms after the usual ablutions and while still wet have the same mixture well *rubbed in* and the examination made while the hands are wet I have never found my results make me wish I had used gloves When the hands have been soaked in this way with the lysol preparation a slight roughness will remain for two or three days but I do not find this happens when dettol has been substituted I was introduced to this solution at a bacteriological laboratory during the war where it was used for syringes

Granuloma Annulare

"H F P" writes: Could anybody advise me as to the treatment of a girl aged 8 years suffering from granuloma annulare? X rays and various ointments have been tried with only temporary success. It disappears in summer but reappears again each winter and seems to be spreading.

Sequels of Tooth Extraction

"G P" writes: I am attending a woman who has had a wisdom tooth extracted. Soon afterwards her neck became swollen and very painful, she also complains of facial neuralgia going over head and into ear, with difficulty in opening mouth and swallowing. The breath is extremely offensive. I should be much obliged for suggestions as regards any treatment that would cut short this most distressing condition, which sometimes continues for months, completely incapacitating the patient. The neuralgia is most persistent comes on when opening the mouth, and wakes the patient after sleeping. Aspirin 15 grains, bromide, and butyl chloral hydrate and gelsemium have been tried. The latter relieves the neuralgia of the fifth nerve, but not so much the pain spreading from lower jaw into ear and over head.

Income Tax

Estimate of Tax Payable

"M B, B CHIR" gives some particulars of his gross earnings and expenses, and asks for an estimate of the amount of income tax payable.

*** Gross earnings, less common practice expenses		£1,200
Expenses as per list	£330	
Add half local rates	20	
Add half net Schedule A assessment, say	45	
Running costs of car	60	455
		£745
Less depreciation allowance		45
Share of firm's Schedule D assessment		£700
The tax payable on this will be as follows		
Earned income relief one fifth of £700		£140
Personal allowance (married)		180
		£320
Tax payable, therefore, on £700−£320=£380		
On £135 at 1s 7d in the £	£10 13 9	
On £345 at 4s 9d in the £	81 18 9	
	£92 12 6	
Less life assurance allowance, £39 at 2s 4½d in the £	4 12 7	
	£87 19 11	

As against this tax, however, 'M B B Chir' can claim repayment at 4s 9d in the £ in respect of the amount of bank interest paid by him in the year, as he can deduct tax on paying interest to the insurance company no similar relief is due for that interest. Tax will also be payable on the Schedule A assessment of his house.

LETTERS, NOTES, ETC.

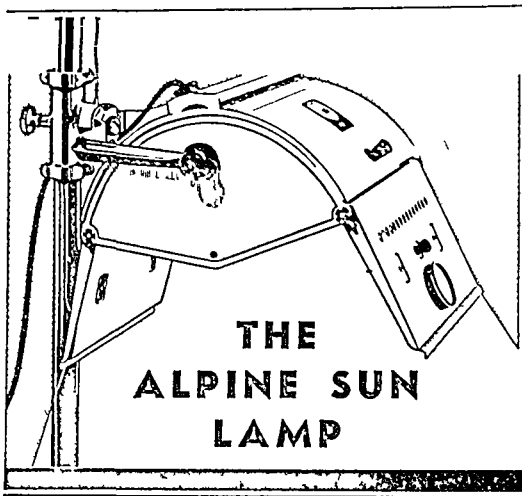
Wax Solvents

Mr M R SHERIDAN F R C S Ed (Truro) writes: If Dr G C Pether (March 6, p 529) will turn up page 168 of *The Principles and Practice of Otology* by Watkyn Thomas and Yates published in 1932 he will find there liq paraffin described and recommended as a solvent of wax in the ear.

Vitamin E

Glaxo Laboratories Ltd (Greenford, Middlesex) have prepared a useful pamphlet describing the therapeutic uses of this anti sterility factor. The existence of vitamin E was proved by Evans as early as 1922, but its therapeutic value is only now being discovered. It is a fat-soluble vitamin found in wheat-germ oil and at present rapid progress is being made in identifying its chemical nature. Female rats deprived of this vitamin grow normally and can conceive but at a certain stage in pregnancy the foetuses die and are reabsorbed. In male rats the deficiency leads to loss of mobility in the spermatozoa and later to azoospermia. Administration of this vitamin by mouth is proving a successful method in the treatment of women who abort habitually. In 1931 Vogt-Moller reported success in this form of treatment and during the last two years several favourable reports have appeared based on relatively large numbers of cases. Less attention seems to have been paid to the possibility of treating male sterility, but here also there would appear to be a possible therapeutic application. The ten year interval between the discovery and the successful clinical use of the vitamin is an interesting point, for it shows how difficult it is to judge at once the ultimate therapeutic importance of a physiological advance.

Sclerosing Submucosal Injection of the Turbinates



Mr ARTHUR MILLER (London, W 1) writes: Further to the correspondence in the *Journal* (February 13, p 359 and February 20, p 416), may I be allowed to state that my respect for the nasal mucosa is such that removal or cauterization of the redundant parts of the turbinates is only resorted to in exceptional cases where there is obvious interference with the drainage of the sinuses, etc. I treat most of these cases by diastolization, thus avoiding any injury to the mucous membrane. The treatment is a somewhat prolonged one (six to eight weeks), but most gratifying. The improvement in nasal breathing is very marked, a number of cases of catarrhal deafness particularly in children respond to it very well. Mr Arthur Wells introduced this treatment in this country in 1926, and I am indebted to him for bringing it to my notice.

New View of Pneumonia

Dr LAURENCE E D KNIGHTS (Cheam, Surrey) writes: The new view of pneumonia presented by Dr W A Morris (*Journal* February 13, p 361) will receive wide support. The raised respiratory rate is not due to a reduction of vital capacity, extensive fibroid phthisis leads to no rise in a patient at rest, and high pyrexia from inflammation outside the respiratory tract—for example, pyelitis—but moderately affects pulmonary ventilation. On the other hand the insidious acute otitis media which characterizes a Group 3 pneumococcus (*Streptococcus mucosus*) infection produces, particularly in children, a "pneumonic" type of respiration when no coexisting pneumonia is present. This always occurs in pneumococcal septicaemia too. In primary pneumococcal peritonitis, almost invariably pelvic, and in arthritis one would not expect on anatomical grounds, a similar degree of toxic absorption to occur, and I believe that rapid respiration is not a feature in these conditions. I would be interested to know the effect on respiration of a pneumococcal osteomyelitis where ready absorption might be expected. With regard to treatment in general my opinion is: (1) The kaolin poultice is of little value, and its application causes unnecessary handling of the patient, with the gamgee jacket it should become of 'historic interest.' (2) The pain of pleurisy is far more efficiently eased by strapping the chest in expiration. (3) Digitalis is a general cardiac poison with a specific effect on the bundle of His. Its use in pneumonia should be restricted to patients with fibrillation and then it should be given with caution to attempt to allay a toxic tachycardia is as misguided as to reduce the laudable temperature with antipyretics. I have seen its exhibition in straightforward pneumonia cases lead to a fatal termination. (4) The patient should recline in the position of greatest comfort, frequently supine, and not as routine in a sitting position. (5) A recent personal experience of pneumonia made me eternally grateful to the physician for prescribing morphine 1/4 grain (together with strychnine 1/20 grain) six-hourly. The relief to the fevered and poisoned mind must be experienced to be appreciated.

Academic Costume

With reference to the letters by "X Y Z" (February 20, p 430) and Dr R R Prewer (February 27, p 482) Dr CLAUDE A P TRUMAN of Exford, Somerset, has sent us a list of non-university bodies which grant hoods. He adds: 'Some long time ago Oxford University granted to S M (*students in medicine*) and students in law (S C L) a hood of black stuff, lined with blue silk. In addition, the University of Durham grants to L Theol and Assoc Sc a black stuff hood, faced with velvet and bound with palatinate purple silk. This does not exhaust the list, I think.'

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

191 Tuberculosis in Nurses

A GULLBRING (*Hygiea Stockh*, December 31, 1936, p 865) draws attention to the fact revealed by recent studies in Scandinavian institutions for the sick, that the frequency with which probationers and nurses contract tuberculosis is much higher in general hospitals than in sanatoria This comparison does not reduce to negligible proportions the risks of nursing the tuberculous in sanatoria, but it emphasizes the unsatisfactory character of the conditions under which nurses work in general hospitals In the author's opinion the most important difference in the two classes of institution concerns the work hours In a general hospital probationers begin work at 6 a m and end it at 8 p m, with only three hours in the interval for food and rest To this eleven hour day is added night duty every fourth night These working conditions are the more onerous for the fact that most probationers are recruited from homes in which continuous and heavy physical work has been conspicuous by its absence In the author's hospital the sixty hour week between 1928 and 1934 has since been reduced to a fifty four hour week With regard to tuberculous infection, he has found that the probationers who were tuberculin negative on joining his hospital showed a subsequent tuberculosis rate of 8 4 per cent, whereas it was only 2 8 per cent among the nurses who were already tuberculin positive when tested as probationers This striking difference has impressed the author with the desirability of not setting tuberculin-negative probationers to work forthwith on tuberculous patients

192 Chronic Meningococcus Septicaemia

E APPELBAUM (*Amer J med Sci*, January, 1937, p 96) who records three illustrative cases in patients aged from 19 to 35, states that chronic meningococcus septicaemia, which was first described by Soloman in 1902, is a distinct clinical entity, which is probably commoner than is generally suspected The characteristic features are headache, intermittent fever, migratory joint pains, and a maculo papular or polymorphous rash The patient's general condition appears good The principal complications are meningitis, endocarditis, nephritis, and epididymitis The diagnosis may be suspected clinically but can only be made definitely by obtaining a culture of the meningococcus from the blood The patient's serum does not as a rule agglutinate meningococci The spinal fluid in cases uncomplicated by meningitis is normal The disease lasts several months, but its duration is considerably shortened by specific treatment The prognosis is usually favourable The disease responds promptly to the intravenous injection of anti meningococcus serum In some cases an autogenous vaccine may be beneficial Spontaneous recovery may occur

193 Surgical Scarlet Fever

E GOTTLIEB (*Ugeskr Laeg* January 7, 1937, p 8) has in the course of only four years seen as many as thirty four cases of surgical wound, or extrapharyngeal scarlet fever at his hospital in Denmark Twenty six of these cases or more than 5 per cent of all the cases of scarlet fever seen, were observed in the year ending November 15, 1936 *In the three earlier years the cases of* surgical scarlet fever represented only about 1 per cent of all the cases of scarlet fever The author traces this change partly to the increased interest taken of late in this condition and partly to the change in different parts of the world in the behaviour of scarlet fever, which has recently assumed a comparatively benign character Common to all his cases was the development of scarlet fever in association with some wound and apparently as a sequel to it, but it remains an open question whether the object inflicting the wound introduced *the infection into it or whether the traumatized* area was infected afterwards as is presumably the case when scarlet fever develops after a burn In three adult cases the condition developed after dental extractions, and in three other cases after operations on the nose for deviation of the septum There were eleven children who contracted surgical scarlet fever in association with infections of the arms and legs, whitlows seeming to be a favourite source of the infection In every case the onset of fever and rash was sudden, and in most cases the condition of the tongue was characteristic With only three exceptions the desquamation ran a textbook course All the patients recovered but the acute stage of the disease was on the whole somewhat more stormy and the rash more marked than in ordinary scarlet fever As many as nine of the thirty four patients were over the age of 15—a comparatively high adolescent plus adult rate only from 8 to 9 per cent of the author's patients suffering from ordinary scarlet fever being over 15 years of age

Surgery

194 Benign Prostatic Hypertrophy

H L CHANG and G Y CHAR (*Chin med J*, December, 1936, p 1707) believe that this condition is comparatively rare in Chinese As the result of 1,900 consecutive post-mortem examinations of persons over 40 years of age in the Peiping Union Medical College Hospital *they found* that about half of the non Chinese (Russians Americans British, and others) showed benign hypertrophy of the prostate while only one fifteenth of the Chinese were similarly affected They suggest that this may be due to the fact that the Chinese believe that the seminal secretions are very essential to life and health, and that consequently most Chinese males, after the age of 50, greatly restrict their sexual activity In addition various other factors, such as diet, endocrine balance, and social and physical activities, must be taken into consideration

195 Thoracoplasty

F KLEIN (*Z Tuberk*, 1936, Bd 76 Heft 6 p 396) advocates thoracoplasty being done in sanatoria as an operative measure *There the patient is in the best possible* environment both before and after operation In any case a stay of five to six months afterwards is essential The main indication for thoracoplasty is the belief that neither conservative nor other operative measure will save the patient His general condition and resistance must be good Unilateral disease with a *marked tendency to* fibrosis affords the best *hope of cure* Patients with no tubercle bacilli in the sputum should only rarely be operated upon In the presence of an unsuccessful pneumothorax air may be withdrawn and operation proceeded with On the day prior to operation strophanthin is given Klein does the rib resection under local anaesthesia Resection of all ribs is done in two stages Brauer's subscapular paravertebral *method* is the one of choice The total length of ribs resected is on the average *180 cm* Resection of the first to fifth ribs may be sufficient Resection of ribs one to six is contraindicated because the angle of the scapula then rides on the seventh rib causing the patient pain Post operative treatment is very important The patient must have a nurse constantly in attendance for the first three days She must see that he lies comfortably and that he breathes deeply every

half-hour, and she must support the affected side when he coughs Digitalis is given for the first three days The sutures are removed on the seventh day, and on the tenth day he is allowed to lie out on the balcony In the absence of complications the patient has returned to his normal routine in three weeks As soon as the scar has healed exercises are undertaken under personal supervision of the physician, so that they may be controlled and not overdone They are carried out for weeks, until the muscular movement is as good as it was before operation

196 Dislocation of the Shoulder

F DEMMER (*Wien klin Wschr*, December 25, 1936, p 1587) doubts the common statement that in shoulder dislocation the head of the humerus passes through a tear in the capsule by which it is "button-holed" in an extracapsular situation and is fixed by muscular force Anaesthesia, he points out, does not relax the fixation gravitation haematomata near the borders of the triceps do not occur clinically the tear of the capsule is not found at operations for habitual dislocation, and plastic cure of this by strengthening the anterior part of the capsule by means of the coraco-brachialis is difficult to understand if the traumatic displacement be extracapsular In one case of primary dislocation coming to operation Demmer found, through a Maisonneuve incision, an intracapsular wedging of the head between the anterior margin of the glenoid cavity and the tense articular capsule If such an intracapsular dislocation were the rule, the frequent success but occasional repeated failures of Kocher's manœuvre would be explicable, also the fact that after the "unsuccessful Kocher" the Hippocratic extension, with foot on axilla, is always effective, whereas this older method, applied in the first instance, without Kocher's manipulations, is often unsuccessful In treating the unanaesthetized patient by Kocher's method Demmer recommends that the patient be prone, and one of the surgeon's unbooted feet should fix the axilla on the sound side

Therapeutics

197 Hypertonic Glucose in Acute Confusional States

S OLDBERG (*Uppsala Lakaref Forh*, December 31, 1936, p 257) reports from the psychiatric clinic in Uppsala his experiences with intravenous injections of hypertonic solutions of glucose in cases of acute confusion and agitation He recalls that cases of acute psychosis often end fatally in asylums under strong persistent agitation and in spite of every treatment In some such cases the post-mortem examination has shown the characteristic picture of 'hirnschwellung," the genesis of which the author discusses in the light of recent research In six male cases of acute confusion and agitation he has given intravenous injections of 10 to 30 c.cm of solutions of glucose in concentrations ranging from 10 to 50 per cent He confined these therapeutic essays to glucose, dispensing with sodium chloride because it is apt to provoke nausea, headache, and fever In one case the injection of glucose had no apparent effect In the remaining five cases it seemed to have a sedative effect and to promote sleep, notably when comparatively large doses (20 to 30 c.cm.) were given In two cases there was a marked improvement in the mental condition with temporary return of lucidity The favourable results could hardly be traced to suggestion in view of the patients' mental state Even when no immediate beneficial effect was observed sleep seemed to be better on the following night The effects of the injections in the case of a patient receiving eleven in all became slighter after the first five or six, the dosage having to be gradually increased accordingly In most cases the response to an injection came about half an hour after it had been given The author does not consider himself competent at the present stage to give a plausible explanation of the processes leading to the reactions he has observed

198 Erythema from Irradiation

E WELLISCH (*Med Klinik*, January 29, 1937, p 162) describes the conditions in which induction of cutaneous erythema by carefully dosed irradiation with the rays (chiefly, the ultra-violet) of the quartz lamp has been found useful Local applications to the thorax are helpful in asthma, bronchitis, and angina pectoris, to the abdomen in peptic ulcer, and especially in fibrinous peritonitis, to the limbs in neuralgias, to the face in erysipelas and the scalp in alopecia, and also in chronic eczema, psoriasis, and furunculosis Induction of erythema in the whole of the skin by successive irradiation of various areas may be useful in chronic infections of joints, muscles, and nerves probably products of lysis of epidermal cells induce an unspecific protein irritation therapy Irradiations in large doses of extensive body areas are thought to have saved life in cases of carbon monoxide poisoning (in which they promote dissociation of CO and haemoglobin) and in eclampsia Total skin irradiations, owing to the desquamation induced, have also produced improvement in pityriasis versicolor, acne vulgaris, and lichen ruber planus

Laryngology

199 Histamine in Nasal Polypi

C C BUTHRMISTER and W F WENNER (*Arch Otolaryng* Chicago, November, 1936, p 570) assume that oedematous polypi are always allergic in origin Histamine is involved in the allergic phenomena and therefore also in the production of polypoid tissue The authors undertook a comparative analysis of nasal polypi and normal mucous membrane in order to ascertain whether histamine appeared in greater quantities in polypoid tissue than in normal mucous membrane Histamine or a histamine-like substance has been found to be widely distributed in mammalian tissue, it is present in the lymph and blood stream after anaphylactic shock The biological test for it is made on the anaesthetized atropinized male cat The extracts from nasal polypi always produced a fall in blood pressure This fall, expressed as histamine equivalent, shows that polypoid tissue contains from 3·6 to 10·2 mg of histamine-like substance per kilo of moist tissue The extract of nasal secretions in allergic rhinitis caused a slight fall in blood pressure, much less than that caused by an equivalent extract of polypi Histamine is probably absent from the mucin of nasal secretions, and the small amount of depressor activity is due to the proteoses formed during hydrolysis Normal mucous membrane of the nose contains approximately the same amount of histamine-like substance as the moist polypoid tissue But calculated on the basis of the dry weight of the tissues nasal polypi contain more histamine than the normal mucous membrane of the nose

200 Intracranial Complications of Nasal Disease

G HAGERUP (*Hospitalstidende*, December 29, 1936, p 1357) calculates that since an ear department was opened in 1906 at his hospital in Denmark some 1,330 patients attended it suffering from inflammation of the nasal sinuses Up to the end of 1933 there were in this material thirty-three cases of spontaneously developing intracranial complications of the nasal condition To these thirty-three the author adds three other cases in which intracranial complications of sinusitis followed operation The incidence of such complications in this material was thus about 3 per cent Among the thirty-three "spontaneous" cases were fourteen of leptomeningitis and subdural abscess, twelve of brain abscess and cerebral soften

See Supplement, page ii

Students Representative Council and of the Royal Medical Society in Edinburgh After holding a post as tutor in clinical medicine in Edinburgh Royal Infirmary he took up the subject of pathology and became patho logist to that institution and from 1892 held the post of lecturer in pathology at the School of Medicine of the Royal Colleges in Edinburgh He joined the Royal College of Physicians of Edinburgh as a Member in 1891, proceeding to the Fellowship in 1892

In 1899 he was appointed professor of pathology and bacteriology at Birmingham University a post which he held until 1919 During his active years Professor Leith had been examiner in pathology and bacteriology for the Indian Medical Service and for the Universities of Cambridge Bristol Glasgow, and Sheffield as well as for the Royal College of Physicians of Edinburgh and the Royal College of Veterinary Surgeons He was celebrated as a teacher and as a pathologist and his publications included many contributions to medical and scientific journals He may be described as a great all round man for in his Edinburgh days he was a keen tennis player in the celebrated Whitehouse Tennis Club and he was also a member of the polo club at Murrayfield and of the Alpine Club When he retired from the chair at Birming ham in 1919 he spent the winter months regularly at Cannes and the summer at Gullane Scotland where he was a well known figure on the golf links Professor Leith was also a well known collector of china in which he was regarded as a connoisseur and some years ago he divided his valuable collection of china between Birming ham Art Gallery and the Royal Scottish Museum in Edinburgh He was a man of many friends and his death will be widely regretted He joined the British Medical Association in 1888 was vice president of the Section of Pathology at the Toronto Meeting in 1906 and president of the same Section at the Birmingham Meeting in 1911 In 1934 he made a donation to Birmingham University of £1 000 as foundation for a prize in pathology His portrait hangs in the great hall of the university at Edgbaston

SIR JOHN ROBERTSON

Dr JAMES F BRAILSFORD writes With the passing of Sir John Robertson one of the great pioneers of preventive medicine has left us Only those who worked with him can appreciate how devoted and untiring he was in this labour There was no sphere of public health work in which he did not take a leading part and we owe to him a great measure of the success and benefit which this work has achieved Until his death he actively discharged his duties as professor of hygiene and public health at the University of Birmingham a post which he had held for nearly a quarter of a century He organized and took a large part in courses of training for all branches of public health service His popular lectures secured the willing co operation of all sections of the public

He was a great teacher who loved his work and inspired his students with a desire to obtain the goal which he so ardently desired and for which he so faith fully and unsparingly worked But above all he was a kindly man possessed of a charming old world modesty and courtesy of manner which endeared him to all Easy of approach to all and ready at all times no matter how sorely pressed by his manifold duties to give his sym pathetic hearing and advice there must be many of us who owe to him not only advice in the planning of but also much support in our early careers We mourn his loss and extend our sympathy to his wife and children In the words of the leader in the *Birmingham Mail* No one can measure the boon which he conferred upon the community His memory will be preserved on the tablets which record the names of great public servants pro fessional and voluntary for his work was at no time and in no wise bounded by the limits of his official responsi bilities, great though these were '

We regret to announce the death of Dr EDWARD JAMES LLOYD for many years a leading practitioner at Bangor North Wales He was born in 1850 and studied medicine at St Bartholomew s Hospital and Aberdeen graduating M B , C M Aberd with honours in 1873 He proceeded M D in 1875 and became M R C S Eng in 1877 Imme diately after qualifying he acted as civil surgeon in the Transport Service of the Ashantee Expedition In later life he reached the rank of surgeon colonel to the 1st Cheshire and Carnarvonshire R G A Vol receiving the Volunteer decoration Dr Lloyd was for twenty years surgeon to the Carnarvonshire and Anglesea Infirmary, and on retirement from the active staff was elected con sulting physician He joined the British Med cal Asso ciation in 1873 and was president of the North Wales Branch in 1888 He was also a past president of the Menai Medical Society The funeral at Bangor on December 18th was largely attended

We regret to record the death in London on December 22nd 1936 of Dr EDWARD FULLER MARTIN of Weston super Mare in his eightieth year Dr Martin was the son of the late Dr Edward Martin and was born at Bristol in 1857 He received his medical education at Edinburgh University where he graduated M B in 1879 and received the diploma of membership of the Royal College of Surgeons of England and in 1895 he proceeded to the M D and C M degrees Dr Martin settled in general practice in Weston super Mare becoming surgeon to the hospital there and on retirement from the active staff in 1927 was elected consulting surgeon He had been a member of the British Medical Association since 1880

The Services

PARKES MEMORIAL PRIZE 1936

UNIVERSITY OF LEEDS

The annual report of the University, presented at a meeting of the Court held on December 23rd, 1936, records that during the past educational year the number of full-time students in attendance during the year was 1,663, the highest figure attained since the institution of the University, and an increase of exactly 1,000 above the number in attendance in the last year before the great war In the Faculty of Medicine it was decided that as soon as possible Readers in Medicine and in Surgery should be appointed, so that the University might by the appointment of whole time clinical investigators, make its contribution to what has come to be one of the most promising methods of developing medical knowledge

THE ROYAL ALEXANDRA HOSPITAL FOR SICK CHILDREN, DYKE ROAD, BRIGHTON

ELECTION OF HONORARY ANAESTHETISTS

The Election Committee of the Hospital will meet on Friday, April 2nd, at 3 p.m., and it is hereby convened for the purpose of electing one Honorary Anæsthetist who will be a Member of the Permanent Honorary Medical Staff and two Honorary Assistant Anæsthetists who will be appointed for a period of two years in the first instance but who may seek re-election at the end of that time.

Candidates must be registered under the Medical Act.

All candidates are required to transmit their applications and testimonials under cover to the undersigned not later than Saturday, March 27th, and must hold themselves in readiness to attend the meeting of the Election Committee on the day of election.

Any candidate personally or through an agent canvassing members of the Election Committee will be disqualified, *ipso facto*, from holding the office for which he is a candidate, but every candidate will have an opportunity of appearing before the Election Committee, and may send a copy of his testimonials to the members of the Committee of Election not more than ten days before the meeting of the Election Committee.

Further information can be obtained if desired from the Secretary of the Hospital.

Board of Governors' Hospital.

March 6th, 1937.

HOSPITAL OF ST. CROSS, RUGBY
(120 Beds)

Applications are invited for the post of TWO MALE RESIDENT MEDICAL OFFICERS (Three P.M.O.).

Salary to commence at the rate of £100 per annum for the first three months, £125 per annum for a second three months, and at the rate of £150 per annum for subsequent months. Full board, washing, etc., provided.

Six months' appointment, and eligible on completion of service for further extension of six months.

One candidate must be prepared to commence duties immediately. The other candidate will be required to commence duties on April 5th.

The practice of the Hospital offers excellent opportunities for wide experience.

Certificates and other fees shared by R.M.O.s.

Application, stating age, nationality, and full details, with copies of three recent testimonials, to be sent to the undersigned.

(Signed) W. COCKBURN,
Supt. & Sec.

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS
NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C.M.G., A.D.C.

Medical Superintendent DANIEL F. RAMBAUT M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients, and certified patients of both sexes, are received for treatment. Careful clinical biochemical bacteriological, and pathological examinations. Private rooms with special nurses male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombieres treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation Therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the beach. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

HIS MAJESTY'S COLONIAL SERVICE

COLONIAL MEDICAL SERVICE

It is anticipated that not less than 30 vacancies for Medical Officers will occur in 1937 The majority of these will occur in Tropical Africa and in Malaya

QUALIFICATIONS —Candidates must be British subjects of European parentage, under 30 years of age and must possess a medical qualification registrable in the United Kingdom Preference will be given to candidates who have held Hospital or Public Health appointments or who have special knowledge of anaesthetics, radiology, surgery medicine, ophthalmology, gynaecology and midwifery, diseases of the ear, nose, and throat, venereal diseases, etc

SALARY —Initial salaries vary from £600 to £700 and rise by increments to a maximum of between £1,000 and £1 200

PRIVATE PRACTICE —Private practice is not allowed as of right, but in the case of some appointments it is permitted on certain conditions

QUARTERS —In Tropical Africa free quarters, or an allowance in lieu, are provided In Malaya quarters are provided at an annual rental not exceeding 6 per cent of the officer's salary

PASSAGES —Free first class passages are provided on first appointment and when proceeding on and returning from leave Assistance is also given towards family passages

TERMS OF APPOINTMENT —The appointments are pensionable, subject to a probationary period which varies from two to three years

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE —Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas

DUTIES —Although Medical Officers are appointed in the first instance for general service, there are opportunities for work in special branches of medicine and surgery, in public health and in medical research

Further particulars and forms of application may be obtained from the Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S W 1
